(57) An anticancer agent, an antiviral agent or an antimicrobial agent which contains, as an active ingredient for acting on DNA, a compound presented by the following formula (1) or its pharmacologically acceptable salt:

**EP 0 719 765 A2**

## Description

The present invention relates to compounds which are novel phenylbenzimidazole derivatives which bond to DNA and inhibit the growth of cells, and it also relates to compositions which comprise these derivatives and to the use of these derivatives for the preparation of anticancer agents, antimicrobial agents and antiviral agents.

Some of compounds which act on DNA can be used as anticancer agents. For example, adriamycin has been useful as an anticancer agent which intercalates DNA. Furthermore, compounds such as cisplatin and mitomycin which react with DNA have also often been used. Such an anticancer function based on the action on DNA can be considered to be established to some extent, though all of the function cannot be elucidated. On the other hand, in recent years, distamycin and netropsin have been noticed as substances which bond to DNA to exert an anti-tumor activity [Nature, Vol. 203, p. 1064-1065 (1964)]. Much attention has been paid to these substances as groove binders which are different from the conventional anticancer agents in a bonding mechanism to DNA. In addition, a compound such as Hoechst 33258 [Nucleic Acids Research, Vol. 16, p. 2671-2690 (1988)] is also known whose bond to DNA has already been confirmed.

However, it cannot be presently presumed at all from the knowledge regarding the conventional anticancer agents what moiety of each anticancer agent is an actually necessary structure or what other structure can be substituted. Nevertheless, it is valuable to predict and search the presence of another compound having a desirable structure. Such a search of the new structure is considered to be particularly required for the creation of a novel anticancer agent.

Moreover, compounds in which an alkylating agent is bonded to the distamycin derivatives are known, and typical examples of such compounds are described in J. Am. Chem. Soc., Vol. 107, p. 8266 (1985), EP-A-246868, WO 93-13739, J. Med. Chem., Vol. 32, p. 774 (1989), and the like. Other compounds are also known in which an alkylating agent is bonded to a compound similar to the distamycin (US-A-5273991). In several of these compounds, a bis(2-chloroethyl)amino residue is used as the alkylating agent, but it is already known that this residue is a part of the structure of the anticancer agent. For example, chlorambucil is known as the anticancer agent having the bis(2-chloroethyl)amino residue in its molecule. The anticancer activity of this compound is presumed to be the result of its alkylation to DNA, an enzyme or the like. However, the merit of adding the alkylating agent having a chloroethylamine structure as a partial structure of the anticancer agent which bonds to DNA has scarcely been recognized so far.

The above-mentioned distamycin is a typical example of the compounds which bond to DNA, but compounds which have benzimidazole in each molecule and which can bond to DNA are also known. For example, Hoechst 33258 has a structure containing two benzimidazoles, a phenol and a piperazine. In this compound, however, a feature that aromatic rings are bonded via amide bonds as in the distamycin is not present. Comparing these structures with each other, the structures which can bond to DNA are definitely different from each other. That is to say, the structures capable of bonding to DNA can be classified into some groups, but there has not been found any report in which the evaluation of their usefulness is made.

The present inventors have searched a novel structure in expectation of the presence of a compound which has a structure other than known compounds, partially maintaining the structure of benzimidazole and which has an anticancer function. As a result, novel compounds having a structure, in which a phenyl group is directly bonded to benzimidazole and another substituent is added via an amide bond, have been selected as useful anticancer agents. Above all, 1H-2-phenylbenzimidazole-5-carboxamide derivatives have been particularly selected. These compounds possess novel structures. Furthermore, these compounds show an inhibitory activity on tumor cell growth equal to that of distamycin in vitro. This activity as the anticancer agent has also been newly found by the present inventors.

The activity as the anticancer agent can probably be enhanced by the addition of an alkylating agent. This has been simultaneously investigated, and as a result, it has been apparent that a compound containing the alkylating agent exerts a higher anti-tumor activity as compared with another compound containing no alkylating agent. It has been understood from this fact that the compound having the skeleton of phenylbenzimidazole can become a high-active anticancer agent by adding the alkylating agent into the molecule of the compound.

On the basis of the above-mentioned knowledge, the present inventors have completed the invention of novel anticancer agents.

An object of the present invention is to provide a novel compound which acts on DNA, or a novel compound which has a partial structure capable of acting on DNA and which is useful as an anticancer agent.

A compound of the present invention which can achieve the above-mentioned object is a compound represented by the following formula (1) or its pharmacologically acceptable salt:

wherein each of m and n is independently an integer of from 0 to 5; each of R<sub>1</sub> and R<sub>2</sub> is independently a hydrogen atom, a halogen atom, an alkylthio group having 1 to 8 carbon atoms, preferably 1 to 4 carbon atoms, an amino group which may be substituted, an ammonium group which may be substituted, a sulfonium group which may be substituted, a hetero-six-membered ring group which may be substituted, a hetero-five-membered ring group which may be substituted, a hetero-six-membered ring group which may be substituted, an amidino group, a guanidino group, an amino acid residue or a group represented by the formula (2)

wherein R<sub>3</sub> is a direct bond or an oxygen atom (when R<sub>3</sub> is an oxygen atom, m or n of (CH<sub>2</sub>)<sub>m</sub> or (CH<sub>2</sub>)<sub>n</sub> to which R<sub>3</sub> bonds is not 0); R<sub>4</sub> is a hydrogen atom, an alkyl group having 1 to 8 carbon atoms, an alkoxy group having 1 to 8 carbon atoms, a halogen atom, a trifluoromethyl group, a cyano group, an amidino group, a carboxyl group or -COR<sub>7</sub> wherein R<sub>7</sub> is an alkylamino group having 1 to 8 carbon atoms which may be substituted by a substituted amino group, an amino group which may be substituted by a phenyl group which may be substituted, or a benzylamino group having 1 to 8 carbon atoms substituted; R<sub>5</sub> is a hydrogen atom, an alkyl group having 1 to 8 carbon atoms, an alkoxy group having 1 to 8 carbon atoms or a halogen atom; R<sub>6</sub> is a -(CH<sub>2</sub>)<sub>p</sub>N(R<sub>8</sub>)<sub>2</sub> or -(CH<sub>2</sub>)<sub>p</sub>NR<sub>8</sub>R<sub>9</sub> wherein p is an integer of from 0 to 5; R<sub>8</sub> is -CH<sub>2</sub>CH<sub>2</sub>W wherein W is a halogen atom, a hydroxyl group, a mesyloxy group or a tosyloxy group or -OCOR<sub>7</sub> wherein R<sub>7</sub> is as defined above; R<sub>9</sub> is an alkyl group having 1 to 5 carbon atoms or a mesyl group; and the phenyl group in formula (1) having a R<sub>1</sub>(CH<sub>2</sub>)<sub>m</sub>CONH group can be substituted by the R<sub>1</sub>(CH<sub>2</sub>)<sub>m</sub>CONH group at any position, preferably at the 3-position or the 4-position of the phenyl group.

The compound of the present invention acts on DNA, and so it is useful as an active ingredient of an anticancer agent, an antiviral agent or an antimicrobial agent.

Now, the present invention will be described in more detail.

In formula (1), examples of "a halogen atom" represented by R<sub>1</sub> or R<sub>2</sub> include Cl, Br and I. Examples of "an amino group which may be substituted" represented by R<sub>1</sub> or R<sub>2</sub> include an amino group, monoalkylamino groups and dialkylamino groups substituted by a straight-chain or a branched alkyl group having 1 to 8 carbon atoms. As the dialkylamino groups, those having the alkyl groups of 1 to 4 carbon atoms are desirable. Above all, a methylamino group, ethylamino group, n-propylamino group, isopropylamino group, n-butylamino group, dimethylamino group, diethylamino group, dipropylamino group and diisopropylamino group are desirable.

Examples of "an alkylthio group having 1 to 8 carbon atoms" represented by R<sub>1</sub> or R<sub>2</sub> include straight-chain and branched alkylthio groups having 1 to 8 carbon atoms, and typical suitable examples thereof include a methylthio group, ethylthio group, n-propylthio group, isopropylthio group, n-butylthio group, isobutylthio group, t-butylthio group, n-pentylthio group, n-hexylthio group, n-heptylthio group and n-octylthio group.

Examples of "an ammonium group which may be substituted" represented by R<sub>1</sub> or R<sub>2</sub> include a trimethylammonium group, a triethylammonium group and ammonium groups represented by the following formulae (3-1) to (3-14):

40 The acid residue found as a counter ion to the cationic ammonium group which may be substituted" is required to be usable as a portion of drug, and examples of the acid residue include inorganic acid residues for example derived from hydrogen chloride, hydrogen iodide, hydrogen bromide, tetrafluoroboric acid, perchloric acid and phosphoric acid, organic sulfonic acid residues such as methanesulfonic acid, toluenesulfonic acid, camphorsulfonic acid and 1,5-naphthalenedisulfonic acid, and carboxylic acids such as lactic acid, maleic acid and malonic acid. In these formulae, each of R<sub>11</sub> and R<sub>12</sub> is independently a straight-chain or a branched alkyl group having 1 to 8 carbon atoms, and suitable examples thereof include a methyl group, ethyl group, n-propyl group, isopropyl group, n-butyl group, isobutyl group, t-butyl group, n-pentyl group, n-hexyl group, n-heptyl group and n-octyl group.

45 Examples of "a sulfonium group which may be substituted" represented by R<sub>1</sub> or R<sub>2</sub> include sulfonium groups substituted by a straight-chain or a branched alkyl group having 1 to 3 carbon atoms, and typical examples thereof include a dimethylsulfonium group, diethylsulfonium group, methylethylsulfonium group, methylpropylsulfonium group, diisopropylsulfonium group, methylisopropylsulfonium group, and sulfonium groups represented by the formulae (4-1) or (4-2):

The acid residue bound to the above "sulfonium group which may be substituted" is required to be usable as a portion of drug, and examples of the acid residue include inorganic acid residues such as hydrogen chloride, hydrogen iodide, hydrogen bromide, tetrafluoroboric acid, perchloric acid and phosphoric acid, organic sulfonic acid residues such as methanesulfonic acid, toluenesulfonic acid, camphorsulfonic acid and 1,5-naphthalenedisulfonic acid, and carboxylic acids such as lactic acid, maleic acid and malonic acid. In these formulae,  $R_{11}$  is a straight-chain or a branched alkyl group having 1 to 8 carbon atoms, and suitable examples thereof include a methyl group, ethyl group, n-propyl group, isopropyl group, n-butyl group, isobutyl group, t-butyl group, n-pentyl group, n-hexyl group, n-heptyl group and n-octyl group.

Examples of "a phenyl group which may be substituted" represented by  $R_1$  or  $R_2$  include a phenyl group which may be substituted with at least one of halogen atoms (a fluorine atom, a chlorine atom, a bromine atom and an iodine atom), straight-chain and branched alkyl groups having 1 to 5 carbon atoms, straight-chain and branched alkoxy groups having 1 to 3 carbon atoms, alkoxycarbonyl groups having 2 to 4 carbon atoms, a trifluoromethyl group, a cyano group, an amidino group, a guanidino group and dialkylamino groups in which the alkyl groups have 1 to 3 carbon atoms, respectively. Suitable examples thereof include a chlorophenyl group, dichlorophenyl group, trichlorophenyl group, bromophenyl group, dibromophenyl group, tribromophenyl group, fluorophenyl group, difluorophenyl group, trifluorophenyl group, methylphenyl group, ethylphenyl group, n-propylphenyl group, isopropylphenyl group, n-butylphenyl group, isobutylphenyl group, t-butylphenyl group, n-pentylphenyl group, methoxyphenyl group, ethoxyphenyl group, n-propyloxyphenyl group, isopropyloxyphenyl group, methoxycarbonylphenyl group, ethoxycarbonylphenyl group, n-propyloxycarbonylphenyl group, trifluoromethylphenyl group, cyanophenyl group, amidinophenyl group, guanidinophenyl group, dimethylaminophenyl group, diethylaminophenyl group, dipropylaminophenyl group, methoxyphenyl group and 3,4,5-trimethoxy group. In the case of monosubstitution, the position of the substituent on the phenyl group is the 2-, 3- or 4-position; in the case of disubstitution, the positions of the substituents thereon are two positions of the 2-, 3-, 4-, 5- and 6-positions; and in the case of trisubstitution, the positions of the substituents thereon are three positions of the 2-, 3-, 4-, 5- and 6-positions, unless otherwise noted.

Examples of "a hetero-five-membered ring group which may be substituted" represented by  $R_1$  or  $R_2$  include a pyrrolyl group, furyl group, thienyl group, imidazolyl group, oxazolyl group, pyrazolyl group, thiazolyl group, isothiazolyl group, isoxazolyl group, pyrrolinyl group, imidazolidinyl group, pyrazolidinyl group, pyrazolinyl group, furazanyl group, tetrahydrofuranlyl group, triazolyl group and tetrazolyl group.

Examples of "a hetero-six-membered ring group which may be substituted" represented by  $R_1$  or  $R_2$  include a pyridyl group, pyrimidinyl group, pyranlyl group, pyrazinyl group, pyridazinyl group, piperidyl group, piperazinyl group, thiomorpholino group, 4-methyl-1-piperazino group, 4-benzyl-1-piperazino group, 1-morpholino group, 1-piperidino group, 4-piperidino group and 4-methyl-1-piperidino group.

Here, in the above-mentioned "a hetero-five-membered ring group which may be substituted" and "a hetero-six-membered ring group which may be substituted", the passage "may be substituted" means that this group may be substituted by, for example, a halogen atom (a fluorine atom, a chlorine atom, a bromine atom or an iodine atom), a straight-chain and branched alkyl group having 1 to 5 carbon atoms, a straight-chain and branched alkoxy group having 1 to 5 carbon atoms, an alkoxycarbonyl group having 2 to 4 carbon atoms, a haloalkyl group having 1 to 3 carbon atoms, a cyano group, an amidino group and/or a dialkylamino group having 1 to 3 carbon atoms.

"An amino acid residue" as  $R_1$  or  $R_2$  is defined specially in the present invention as a group which can be obtained by omitting a carboxyl group from an amino acid. Suitable examples of this amino acid include arginine, histidine and lysine.

"A direct bond" represented by  $R_3$  means that the substituted or non-substituted phenyl group in the formula (2) is directly bonded via no  $R_3$ .

Examples of a halogen atom represented by  $R_4$  or  $R_5$  in the formula (2) include F, Cl, Br and I.

Suitable examples of a halogen atom of W in  $-\text{CH}_2\text{CH}_2\text{W}$  represented by  $R_8$  include Cl and Br.

Preferable examples of an alkyl group having 1 to 8 carbon atoms represented by  $R_4$  or  $R_5$  include a methyl group, ethyl group, n-propyl group, isopropyl group, n-butyl group, isobutyl group, t-butyl group, n-pentyl group, n-hexyl group, n-heptyl group and n-octyl group.

Preferable examples of an alkoxy group having 1 to 8 carbon atoms represented by  $R_4$  or  $R_5$  include a methoxy group, ethoxy group, n-propyloxy group, isopropyloxy group, n-butoxy group, isobutoxy group, t-butoxy group, n-pentyloxy group, n-hexyloxy group, n-heptyloxy group and n-octyloxy group.

5 Preferable examples of "an alkylamino group which may be substituted by a substituted amino group" represented by  $R_7$  include a dimethylaminoethyl group, dimethylaminopropyl group, dimethylaminobutyl group, diethylaminoethyl group, diethylaminopropyl group, diethylaminobutyl group, dipropylaminoethyl group, dipropylaminopropyl group, dipropylaminobutyl group, diisopropylaminoethyl group, diisopropylaminopropyl group and diisopropylaminobutyl group.

Preferable examples of "an amino group which may be substituted by a phenyl group which may be substituted" represented by  $R_7$  include aniline, 4-dimethylaminoaniline and 4-chloroaniline.

10 Preferable examples of "a benzylamino group which may be substituted" represented by  $R_7$  include benzylamine and 4-dimethylaminobenzylamine.

As a pharmacologically acceptable salt, any salt is acceptable, so far as it is usable as a drug, and examples of the pharmacologically acceptable salt include inorganic acid salts such as hydrochlorides, hydrobromates, hydroiodates, sulfates, nitrates and phosphates, and organic acid salts such as methanesulfonates, toluenesulfonates, camphorsulfonates, acetates, fumarates, maleates, citrates, oxalates and tartrates.

Next, the compounds represented by formula (1) will be classified into groups A and B, and typical preparation processes thereof will be described.

Group A: A compound in which  $R_1$  is a hydrogen atom, a halogen atom or a group represented by formula (2), or its pharmacologically acceptable salt.

20 Group B: A compound in which  $R_2$  is a hydrogen atom, a halogen atom or a group represented by formula (2), or its pharmacologically acceptable salt.

In the undermentioned description and examples, the following abbreviations represent the corresponding compounds:

25 "DCC" ... N,N'-dicyclohexylcarbodiimide,  
 "CDI" ... N,N'-carbonyldiimidazole,  
 "HOSu" ... N-hydroxysuccinimide,  
 "EDCI" ... 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride,  
 "DECP" ... Diethyl cyanophosphonate,  
 "HOBt" ... 1-hydroxybenzotriazole,  
 30 "DMAP" ... 4-dimethylaminopyridine,  
 "DMF" ... Dimethylformamide,  
 "THF" ... Tetrahydrofuran,  
 "DMSO" ... Dimethyl sulfoxide,  
 "IPA" ... Isopropanol,  
 35 "chlorambusyl" ... 4-[4-bis(2-chloroethyl)amino]phenyl]butyric acid, and  
 "Pd/C" ... Active carbon with palladium (usually, the palladium content is 5-10%).

#### I. Synthesis of an intermediate

40 As shown in the following reaction formula (1), an aldehyde of formula (6) and 3,4-diaminobenzoic acid or its ester of formula (7) are heated at a temperature of from 100°C to a reflux temperature, preferably at 130 to 200°C in nitrobenzene, and the temperature of the reaction system is then returned to room temperature. A produced 1H-2-phenylbenzimidazole-5-carboxylic acid derivative or its ester derivative represented by formula (5) can be collected by filtration:

Reaction formula (1):

Reaction formula (1)

Here, when the ester is obtained, this ester can be hydrolyzed as shown in the following reaction formula (2), thereby obtaining a 1H-2-phenylbenzimidazole-5-carboxylic acid derivative represented by formula (8):

Reaction formula (2):

Reaction formula (2)

No particular restriction is put on the amounts of the aldehyde of formula (6) and the 3,4-diaminobenzoic acid ester of formula (7), but in general, the amount of the latter is in the range of from 80 to 120 mol parts with respect to 100 mol parts of the former. The reaction in nitrobenzene is carried out by heating, until the starting materials have disappeared, while the progress of the reaction is observed, but in either case, a heating time of 5 to 100 hours leads to successful results. The heating may be carried out continuously or intermittently, but the total heating time should be in the above-mentioned range. The hydrolysis of the ester can be accomplished by heating the ester in the presence of sodium hydroxide or potassium hydroxide in a mixed solvent of water and ethanol or water and methanol. In this case, the ratio of water is in the range of from 5 to 90% by weight, preferably from 40 to 60% by weight.

The heating temperature is in the range of from 50°C to a reflux temperature.

Concretely, if 3-nitrobenzaldehyde or 4-nitrobenzaldehyde is selected as the starting material, 1H-2-(3-nitrophenyl)benzimidazole-5-carboxylic acid or 1H-2-(4-nitrophenyl)benzimidazole-5-carboxylic acid can be synthesized by the same procedure as described above. The compound represented by the formula (8) can be used for the synthesis of compounds in the groups A and B.

## II. Synthesis of a compound in the group A

As shown in the following reaction formula (3), for example, an amino compound represented by formula (9) having  $R_2$  [which is as defined above in the case of the formula (1)] is bonded to a carboxylic acid represented by formula (8) in the presence of a suitable condensing agent such as DCC, CDI, EDCI or DECP to obtain an intermediate of formula (10). Next, the nitro group of this intermediate is reduced to a corresponding amino compound of formula (11) by catalytic hydrogenation, and this amino compound is then reacted with a carbonyl compound represented by formula (12) having  $R_1$  [which is a hydrogen atom, a halogen atom or a group represented by formula (2)] to synthesize a compound of formula (1) in the group A:

Reaction formula (3):

Reaction formula (3)

As a solvent for use in the bonding of the amino compound of formula (9) and the carboxylic acid of formula (8) in the presence of the condensing agent, various kinds of solvents are usable, but DMF or a mixed solvent containing DMF is preferred.

The reaction is preferably carried out in the range of from  $-5$  to  $30^\circ\text{C}$ . During the reaction, the progress of the reaction can be observed, but a reaction time is usually in the range of from 1 to 50 hours.

As the amino compound represented by formula (9) having  $R_2$ , there can be used a compound synthesized from known compounds by combining known reactions, or a commercially available reagent. For example, when dimethylaminopropylamine, diethylaminopropylamine or dipropylaminopropylamine is used as the compound of formula (9), a product can be obtained in which  $R_2$  is a substituted amino group. Alternatively, when methylthiopropylamine, ethylthiopropylamine, propylthiopropylamine or butylthiopropylamine is used, an alkylthio group can be introduced into  $R_2$ . Furthermore, when aminopropyltrimethylammonium or aminopropyltriethylammonium is used, a trimethylammonium group or a triethylammonium group can be introduced into  $R_2$ . The phenyl group which may be substituted, the hetero-five-membered ring group which may be substituted, or the hetero-six-membered ring group which may be substituted can be introduced into  $R_2$  of the compound in the group A by using the compound of formula (9) in which  $R_2$  is the group to be introduced.

A compound in which  $R_2$  is an amidino group can be synthesized as follows.

As shown in the following reaction formula (4), the carboxylic acid of formula (8) is first reacted with  $\beta$ -aminopropionitrile to obtain a reaction mixture containing a compound of formula (13).

At this time, a usual condensing agent such as DCC, CDI, EDCI or DECP can be used. A method in which HOBT or HOSu is added to DCC can also be used. The reaction is suitably carried out at  $0$  to  $30^\circ\text{C}$ .

Next, this reaction mixture is suspended in ethanol, and a hydrogen chloride gas is then fed. Afterward, the resultant crystal is collected by filtration, and then dissolved or suspended in a solvent. Ammonia gas is further introduced into the solution to obtain a desired amidino compound represented by formula (14). In this case, the solvent is preferably ethanol or a mixed solvent of ethanol and methanol. In the mixed solvent, the ratio of ethanol can optionally be selected in the range of from 10 to 100%. If this amidino compound is used as the compound of formula (10) in reaction formula (3), the compound of the group A in which R<sub>2</sub> is an amidino group can be obtained:

Reaction formula (4):

Reaction formula (4)

Typical examples of the compound of formula (8) in the reaction formulae (3) and (4) include 1H-2-(3-nitrophenyl)benzimidazole-5-carboxylic acid or 1H-2-(4-nitrophenyl)benzimidazole-5-carboxylic acid.

Next, reference will be made to a synthesis method of a compound in which R<sub>1</sub> is a desired group.

For example, a compound in which R<sub>1</sub> is a substituent represented by formula (2) can be synthesized by a process shown by the following reaction formula (5):

Reaction formula (5):

Reaction formula (5)

In the first place, a carboxylic acid ester derivative of formula (15) having a nitro group is reduced to a corresponding amino compound of formula (16) by catalytic hydrogenation using Pd/C as a catalyst. At this time, methanol, ethanol, DMF and the like can be used singly or in the form of a mixture of two or more thereof as a solvent. The reaction is preferably carried out at a temperature of from 0 to 30°C. A reaction time is in the range of from 30 minutes to 2 hours.

As the carboxylic acid derivative represented by formula (15) which can be used herein, there can be used a compound synthesized from known compounds by known reactions, or a commercially available reagent.

Next, the thus produced amino compound of formula (16) is reacted with ethylene oxide to obtain a compound of formula (17). At this time, a mixture obtained by mixing a solvent such as water, THF, dichloromethane or benzene and acetic acid at an optional ratio can be used as a solvent. The reaction is preferably carried out at a temperature of from -20 to 120°C. A reaction time is suitably in the range of from 1 to 50 hours.

Furthermore, the OH group of the compound of formula (17) is replaced with a Cl group by the use of a suitable reagent such as thionyl chloride, oxalyl chloride, phosphorus pentachloride, phosphorus oxychloride, mesyl chloride (in DMF), a combination of mesyl chloride and sodium chloride, a combination of mesyl chloride and lithium chloride, or dichlorotriphenylphosphorane, thereby obtaining a compound of formula (18). The reaction is carried out at a temperature of from 0 to 100°C. The reaction time is in the range of from 20 minutes to 5 hours. In this case, a usual solvent such as chloroform, benzene or toluene can be used. Moreover, this solvent can be mixed with DMF. When thionyl chloride or oxalyl chloride is used, the reaction can be carried out without solvent.

The compound represented by formula (18) can be hydrolyzed with an acid to obtain a carboxylic acid derivative represented by formula (19). For example, the hydrolysis can be successfully accomplished with concentrated hydrochloric acid by heating at a temperature of from 80°C to a reflux temperature. The reaction time is suitably in the range of from 30 minutes to 5 hours.

When this compound of formula (19) is used as the compound of formula (12) in the reaction formula (3), the compound of the group A in which R<sub>1</sub> is a substituent represented by formula (2) can be obtained.

For example, the compound represented by formula (11) can be bonded to the compound represented by formula (19) by the use of a suitable condensing agent such as DCC, CDI, EDCI or DECP. In this case, a usual solvent is usable, but DMF or a mixed solvent containing DMF is preferred. The reaction is preferably carried out in the range of from -5

to 30°C. During the reaction, the progress of the reaction can be observed, but the reaction time is usually in the range of from 1 to 50 hours. Alternatively, the compound of formula (19) can be treated with thionyl chloride or oxalyl chloride in a usual solvent (e.g., methylene chloride, chloroform, toluene and DMF can be used singly or in the form of a mixture of two or more thereof) to obtain an acid chloride, and this product can be then reacted with the compound represented by formula (11) to bond them to each other. Here, the reaction is preferably carried out in the range of from -5 to 30°C. During the reaction, the progress of the reaction can be observed, but the reaction time is usually in the range of from 1 to 50 hours.

Another side chain represented by  $R_1$  can also be prepared by using commercially available reagents and several steps of known reactions.

### III. Synthesis of a compound in the group B

First, a technique of introducing  $R_2$  will be described.

To start with, reference will be made to the synthesis of a compound in which  $R_2$  is, for example, a substituent represented by formula (2).

The introduction of  $R_6$  into the substituent represented by formula (2) can usually be achieved by each of the following two methods.

#### Method A:

As shown in the following reaction formula (6), a halogenated benzene derivative (in formula (20), F is shown as an example of a halogen atom) containing a nitro group and suitable substituents which is represented by formula (20) is reacted with N,N-bis(2-hydroxyethyl)amine to obtain a compound of formula (21). In this time, DMSO is used as a solvent, and the reaction temperature is in the range of from 20 to 150°C. The reaction time is preferably in the range of from 30 minutes to 10 hours. As the halogenated benzene derivative containing the suitable substituents, there can be used a commercially available reagent or a compound which can be synthesized by the use of a known reaction. For example, the halogenated benzene derivative containing an amidino group can be introduced from a halogenated benzene derivative containing a cyano group by the utilization of a known reaction.

Next, the thus obtained intermediate of formula (21) is reacted with a suitable chlorinating agent such as thionyl chloride, oxalyl chloride, phosphorus pentachloride, phosphorus oxychloride, mesyl chloride or a combination of mesyl chloride (in DMF) and sodium chloride to obtain a chloride of formula (22). The reaction is carried out at 0 to 150°C, and a reaction time is in the range of from 5 minutes to 5 hours. As a solvent, there can be used a usual solvent such as chloroform, benzene or toluene. Furthermore, such a solvent can be mixed with DMF. In addition, the reaction can be carried out without solvent.

#### Reaction (6):

Reaction formula (6)

#### Method B:

As shown in the following reaction formula (7), an aniline derivative (in the case that p is 0) or an aminoalkylbenzene derivative (in the case that p is 1 or more) having a nitro group and suitable substituents which is represented by formula (23) is reacted with ethylene oxide to obtain a compound of formula (24). As a solvent at this time, there can be used a

mixture obtained by mixing a solvent such as water, THF, dichloromethane or benzene with acetic acid at an optional ratio. The reaction is suitably carried out at -20 to 120°C, and a reaction time is suitably in the range of from 1 to 50 hours. As the aniline derivative or the aminoalkylbenzene derivative having the nitro group and the suitable substituents, there can be used a commercially available reagent or a compound which can be synthesized by the use of a known reaction.

Next, the compound of formula (24) can be chlorinated with a suitable chlorinating agent such as thionyl chloride, oxalyl chloride, phosphorus pentachloride, phosphorus oxychloride, mesyl chloride (in DMF) or a combination of mesyl chloride and sodium chloride to obtain a compound of formula (25). The reaction is suitably carried out at 0 to 150°C, and the reaction time is in the range of from 5 minutes to 5 hours. As a solvent, there can be used a usual solvent such as chloroform, benzene or toluene. Furthermore, such a solvent can be mixed with DMF. In addition, the reaction can be carried out without solvent in the case of thionyl chloride or oxalyl chloride.

Reaction (7):

Reaction formula (7)

Each of the compounds of formulae (22) and (25) obtained in the above-mentioned methods A and B can be further subjected to the following reaction to introduce the substituent represented by formula (2) into the compound in the group B.

In the first place, each of these compounds (nitro compounds) is catalytically hydrogenated to obtain a corresponding amino compound. The reaction formula in which the compound of formula (22) is used is as follows.

Reaction formula (8):

Reaction formula (8)

The nitro compound of formula (25) can also be converted into the amino compound in the same manner.

When hydrochloric acid is added in an amount equal to or more than mols of the nitro compound, usually in an amount of from 1 to 1.2 mols at the catalytic hydrogenation, the amino compound can be stably obtained. The catalytic hydrogenation is suitably carried out at 5 to 30°C, and a usual solvent can be used. For example, DMF or a mixed solvent of DMF and methanol is desirable. The ratio of DMF in this mixed solvent can be selected in the range of from 5 to 100%, preferably from 20 to 100%.

For the synthesis of the corresponding amino compound from the usual nitrobenzene derivative, there is usually employed the catalytic hydrogenation using Pd/C as a catalyst or a process utilizing a reaction in which tin chloride and hydrochloric acid are used. In particular, as the reduction method of the above-mentioned nitrobenzene derivative to which N,N-bis(2-chloroethyl)amino group is bonded, there is known a reduction method using tin chloride and hydrochloric acid, as reported in, for example, J. Chem. Soc. p. 1972-1983 (1949) or J. Med. Chem. Vol. 33, p. 112 to 121 (1990).

However, in place of this usual method, the following technique can also be used to efficiently perform the reduction reaction, and some treatments subsequent to the reaction can easily be accomplished advantageously. That is to say, the nitro compound which is the starting material is dissolved in a suitable solvent, for example, a single solvent or a mixed solvent of ethanol, methanol, ethyl acetate, THF and DMF, and Pd/C is then added in an amount corresponding to 0.5 to 50% by weight of the nitro compound, followed by hydrogenation at room temperature under atmospheric pressure, to obtain the corresponding amino compound. At this time, hydrochloric acid can be added in an amount equal to or more than mols of the nitro compound, usually in an amount of from 1 to 1.2 mols. The catalyst is removed by filtration and the solvent is then distilled off, followed by a treatment with one or more kinds of suitable solvents such as ethanol, IPA and ether, whereby a desired hydrochloride can be simply obtained.

Furthermore, as shown in the following reaction formula (9), an amino compound of formula (28) can be synthesized from a carboxylic acid of formula (27) in accordance with a process shown in J. Med. Chem. Vol. 33, p. 3014-3019 (1990).

Reaction formula (9):

Reaction formula (9)

By the use of this process, an aminoalkylbenzene derivative can be synthesized in which  $R_3$  is a chain having two or more methylene groups.

Here, the compound of formula (26) corresponds to the compound of formula (28) in which  $n$  is 0 and  $R_6$  is an N,N-bis(2-chloroethyl)amino group. In the following description, therefore, reactions using the compound having formula (28) will be referred to, but needless to say, the compound of formula (26) can be used as the compound of formula (28).

As shown in the reaction formula (10), a benzimidazole derivative of formula (8) is bonded to the amino compound of formula (28) in the presence of a usual condensing agent (CDI, DECP, DCC, a combination of DCC and HOBT, or the like) to synthesize the compound of formula (29).

Reaction formula (10):

Reaction formula (10)

As a solvent for this reaction, DMF is desirable, but another usual solvent can also be used. The state of this reaction can be observed by TLC or the like to confirm the completion of the reaction, but the reaction is preferably carried out for a period of from 1 to 40 hours. The reaction temperature is preferably in the range of from -5 to 40°C.

Moreover, as shown in the following reaction formula (11), the nitro group of the compound of formula (29) can be reduced to a corresponding amino group by catalytic hydrogenation using Pd/C as a catalyst.

Reaction formula (11):

Reaction formula (11)

This reaction proceeds substantially quantitatively. In this case, ethanol, methanol and DMF can be used singly or in a combination of two or more thereof as a solvent. At this time, hydrochloric acid can be added in an amount equal to or more than mols of the nitro compound, usually in an amount of from 1 to 1.2 mols. The reaction is preferably carried out at a temperature of from 0 to 40°C for a period of from 10 minutes to 20 hours.

The bonding of the aniline derivative in the reaction formula (10) and the successive reducing reaction in the reaction formula (11) establish a novel synthetic route which has not been found in literature so far. For example, a bonding reaction of a distamycin derivative and N,N-bis(2-chloroethyl)-1,4-phenylenediamine is disclosed in Japanese Patent Laid-open No. 92933/1994, but in this publication, a distamycin moiety is previously synthesized, and the bonding reaction of N,N-bis(2-chloroethyl)-1,4-phenylenediamine is finally carried out. This is based on a conception that the bonding of an N,N-bis(2-chloroethyl)amino group which is highly chemically reactive is performed in the last step. On the contrary, the present inventors have developed the technique that even if the aniline derivative moiety is previously introduced into the molecule, the desired compound can be obtained in a high yield.

Next, as shown in the following reaction formula (12), the amino compound of formula (30) obtained by the previous reducing reaction is bonded to the carboxylic acid derivative of formula (12) in the presence of a usual condensing agent such as DCC, CDI, EDCI or DECP to introduce a R<sub>1</sub> moiety to the amino compound, thereby obtaining a compound in the group B [R<sub>2</sub> is a group shown in formula (2)].

Reaction formula (12):

20 As a solvent for this reaction, a usual solvent is usable, but DMF or a mixed solvent containing DMF is preferred. The reaction is preferably carried out at a temperature of from 0 to 40°C for a period of from 30 minutes to 40 hours.

The employment of the following process permits the synthesis of a compound in the group B in which R<sub>1</sub> is a hydrogen atom, a halogen atom or a group other than the groups represented by formula (2).

25 For example, as shown in the following reaction formula (13), a compound represented by formula (32) can be methylated in accordance with a technique described in J. Org. Chem., Vol. 25, p. 804-807 (1960) or with the aid of a usual methylating agent (e.g., methyl iodide, dimethylsulfuric acid or methyl p-toluenesulfonate) to obtain a sulfonium derivative represented by formula (33).

30 Reaction formula (13):

50 As a solvent for this reaction, formic acid, acetic acid, acetone or the like can be used. Alternatively, the reaction can be carried out without solvent. The reaction is preferably carried out at a temperature of from 0 to 60°C for a period of from 1 to 60 hours.

A counter anion (I<sup>-</sup>) of the sulfonium compound obtained here can be converted into another anion in a known manner. For example, I<sup>-</sup> can be converted into Cl<sup>-</sup> by the use of a Cl<sup>-</sup> type ion exchange resin (Dowex 1x8).

55 In the above-mentioned reaction formula (12), when a compound in which R<sub>1</sub> is a substituted or an unsubstituted amino group is used as the compound of formula (12), a compound in the group B can be obtained in which R<sub>1</sub> is the substituted or the unsubstituted amino group.

The thus obtained compound in which R<sub>1</sub> is the amino group substituted by two alkyl groups is further alkylated in a known manner, whereby this compound can be converted into a compound in which R<sub>1</sub> is an ammonium group.

Furthermore, as shown in the following reaction formula (14), a compound represented by formula (34) is methylated with methyl iodide to obtain a compound represented by formula (35).

Reaction formula (14):

Reaction formula (14)

At this time, a usual solvent such as methanol, acetone, chloroform or methylene chloride is used. The reaction is preferably carried out at a temperature of from -5 to 50°C for a period of from 1 to 50 hours.

Moreover, as shown in the following reaction formula (15), when the amino compound of formula (30) is reacted with guanidoacetic acid, a compound of formula (36) can be synthesized in which a guanidino group is introduced into R<sub>1</sub>.

Reaction formula (15):

Reaction formula (15)

A compound in which R<sub>1</sub> is an amidino group can be synthesized as follows. First, the amino compound of formula (30) is bonded to a carboxylic acid derivative having a cyano group such as 3-cyanopropionic acid in the presence of a usual condensing agent such as DCC, CDI, EDCI or DECP. As a solvent for this reaction, a usual solvent is usable, but DMF or a mixed solvent containing DMF is preferred. The reaction is preferably carried out at a temperature of from 0 to 40°C for a period of from 1 to 24 hours. The resultant product is dissolved or suspended in a solvent, and a hydrochloric acid gas is then blown thereinto, thereby obtaining an imidated compound. This compound is then dissolved or suspended in the solvent, and an ammonium gas is then blown thereinto, thereby synthesizing the desired compound in which the amidino group is introduced into R<sub>1</sub>. As the solvent, ethanol, methanol or a mixed solvent thereof is used. In

this case, the reaction is preferably carried out at a temperature of from 0 to 40°C for a period of from 30 minutes to 24 hours.

Another compound can be synthesized by changing starting materials under the above-mentioned conditions.

The compounds in the groups A and B can be synthesized as described above, but the synthesis of a compound in which both of  $R_1$  and  $R_2$  are groups represented by formula (2) can be accomplished, for example, as follows.

In the first place, as shown in the following reaction formula (16), a compound (a nitro compound) represented by formula (37) can be reduced to a corresponding amino group of formula (38) by catalytic hydrogenation using Pd/C as a catalyst. In this case, ethanol, methanol and DMF can be used singly or in a combination of two or more thereof as a solvent.

Reaction formula (16):

Reaction formula (16)

At this time, hydrochloric acid can be added in an amount equal to or more than mols of the nitro compound, usually in an amount of from 1 to 1.2 mols. The reaction is preferably carried out for a period of from 10 minutes to 20 hours.

Next, as shown in the following reaction formula (17), the amino compound of formula (38) can be reacted with a carboxylic acid derivative of formula (39) to obtain a compound represented by formula (40).

Reaction formula (17):

Reaction formula (17)

25 At this time, a usual condensing agent (e.g., DCC, CDI, EDCI or DECP) can be used. As a solvent for the above-mentioned reaction, a usual solvent is usable, but DMF or a mixed solvent containing DMF is preferred.

The reaction is preferably carried out at a temperature of from 0 to 40°C for a period of from 30 minutes to 40 hours.

30 Examples of the compound of formula (1) according to the present invention will be enumerated in Table 1 given below. In Table 1, a counter anion is neither shown for an ammonium group nor for a sulfonium group, but any counter anion is usable, so far as it is pharmacologically acceptable. When the counter anion is required to be specified, its typical example will be mentioned.

35 The compounds of the present invention can be used as anticancer agents having excellent activity. Examples of carcinomas to which the compounds of the present invention can be applied include leukemia, osteosarcoma, breast cancer, ovarian cancer, stomach cancer, colon cancer, lung cancer, and head and neck cancer. In addition, the compounds of the present invention can also be utilized as antimicrobial agents and antiviral agents.

Pharmaceutical compositions can be prepared in accordance with well-known techniques.

40 Various dosage forms can be selected in compliance with the purpose of a medical treatment, and typical examples of the dosage forms include solid preparations, liquid preparations and other preparations such as suppositories. These dosage forms will be described in more detail.

Examples of the solid preparations include tablets, pills, powders, granules and capsules; examples of the liquid preparations include injectable solutions, suspensions, syrups and emulsions; and examples of the other preparations include suppositories.

45 In preparing the pharmaceutical compositions in the form of the tablets, there can be used a wide variety of carriers which have been heretofore well known in this field. Examples of the carriers include excipients such as lactose, sucrose, sodium chloride, glucose, starch, calcium carbonate, kaolin, crystalline cellulose and silicic acid; binders such as water, ethanol, propanol, simple syrup, glucose solution, starch solution, gelatin solution, shellac solution, methyl cellulose solution, hydroxypropyl cellulose solution, polyvinyl pyrrolidone solution and carboxymethyl cellulose solution; disintegrators such as dry starch, sodium alginate, agar powder, sodium hydrogencarbonate, calcium carbonate, polyoxyethylene sorbitan fatty acid esters, sodium lauryl sulfate, stearic acid monoglyceride, starch and lactose; disintegration inhibitors such as sucrose, stearic acid, cacao butter and hydrogenated oil; absorption promoters such as quaternary ammonium bases and sodium lauryl sulfate; humectants such as glycerin and starch; adsorbents such as starch, lactose, kaolin, bentonite, colloidal silicic acid, crystalline cellulose and light anhydrous silicic acid; and lubricants such as talc, stearates, boric acid powder and polyethylene glycol.

55 If necessary, the tablets can also take the usual forms of coated tablets such as sugar-coated tablets, gelatin-coated tablets, enteric coated tablets, film-coated tablets, bilayer tablets or multilayer tablets.

In preparing the pharmaceutical compositions in the form of the pills, there can be used a wide variety of carriers which have been heretofore well known in this field. Examples of the carriers include excipients such as glucose, lactose,

starch, cacao butter, hardened vegetable oil, kaolin and talc; binders such as powdered acacia, powdered tragacanth and gelatin; and disintegrators such as carboxymethylcellulose calcium and agar.

The capsules can be prepared in accordance with a usual procedure, i.e., by mixing a compound as an active ingredient with any of the previously enumerated carriers, and then filling the resulting mixture into hard gelatin capsules, soft capsules or the like.

In preparing the pharmaceutical compositions in the form of the injections, solutions, emulsions or suspensions diluents are used. Examples of the diluents which can often be used in this field include water, ethanol, macrogol, propylene glycol, ethoxylated isostearyl alcohol, polyoxylated isostearyl alcohol, polyoxyethylene sorbitan fatty acid esters, cotton seed oil, corn oil, peanut oil and olive oil. Moreover, the compounds of the present invention can also be used in the form of aqueous suspensions prepared by adding water thereto in the presence of a suitable surfactant, or in the form of emulsions prepared with the aid of a surfactant such as polyoxyethylene hardened castor oil (HCO-60). Furthermore, sodium chloride, glucose and/or glycerol may be contained in the pharmaceutical compositions, and a usual solubilizer, buffering agent and/or smoothing agent may be added thereto.

In preparing the pharmaceutical compositions in the form of suppositories, there can be used a wide variety of carriers which have been heretofore well known in this field. Examples of the carriers include polyethylene glycol, cacao butter, higher alcohols, esters of higher alcohols, gelatin and semisynthetic glycerides.

If necessary, the pharmaceutical compositions can contain colorants, preservatives, perfumes, flavors, sweeteners and/or other drugs.

No particular restriction is put on an administration manner of the pharmaceutical compositions of the present invention, and they may be administered in accordance with the form of the pharmaceutical composition, the age, sex and other conditions of a patient and the severity of a disease. For example, the tablets, pills, solutions, suspensions, emulsions, powders, granules, syrups and capsules can be orally administered. The injections can be intravenously administered alone or after being mixed with a usual infusion fluid such as glucose or an amino acid. Alternatively, they may also be administered intramuscularly, subcutaneously or intraperitoneally as required. The suppositories can be administered intrarectally. The dose of the pharmaceutical compositions of the present invention can be suitably determined in compliance with the administration manner, the age, sex and other conditions of a patient, and the severity of a disease. However, the dose should usually be determined so that the amount of the compound as the active ingredient may be in the range of from about 0.001 to 1,000 mg per day for an adult. Moreover, it is desirable that each unit dosage form of the pharmaceutical composition to be administered contains the compound as the active ingredient in an amount in the range of about 0.001 to 1,000 mg.

Generally speaking, anticancer agents, for example, even agents such as adriamycin and cisplatin which have often been used, have no small side effect. At a present technical level, the side effect should be judged in consideration of relations with functional strength, and the problem of the side effect is unavoidable to some extent. The side effect of the compounds according to the present invention is at such a level as to be acceptable as the anticancer agents.

The numbers of compounds in the undermentioned examples correspond to those of the compounds enumerated in Table 1.

#### Example 1 (Compound 47)

1H-2-[3-[[4-[4-[N,N-bis(2-chloroethyl)amino]phenyl]butyryl]amino]phenyl]benzimidazole-5-[N-(2-amidinoethyl)carboxamide hydrochloride

#### Reaction 1

1H-2-(3-nitrophenyl)benzimidazole-5-carboxylic acid

In 100 ml of nitrobenzene were dissolved 2.0 g (13.1 mmols, 1.0 eq.) of 3,4-diaminobenzoic acid and 2.0 g (13.2 mmols) of m-nitrobenzaldehyde, and the mixture was then heated and stirred for 21.5 hours in an oil bath at 155°C. The resulting solid was collected by filtration, and then washed with IPA to obtain 1.88 g (6.64 mmols, 50.3%) of the desired compound in the state of yellowish green white crystals.

mp: >270°C

NMR (DMSO-d<sub>6</sub>) δ: 9.03 (s, 1H), 8.64 (d, 1H), 8.36 (d, 1H), 8.31-8.17 (m, 1H), 7.89 (t, 2H), 7.80-7.68 (m, 1H)

Reaction 2

1H-2-(3-nitrophenyl)benzimidazole-5-[N-(2-cyanoethyl)]carboxamide

1.0 g (3.53 mmols) of 1H-2-(3-nitrophenyl)benzimidazole-5-carboxylic acid was suspended in 20 ml of DMF, and 0.69 g (4.26 mmols, 1.2 eq.) of CDI was then added, followed by stirring at room temperature in a nitrogen atmosphere. After 3.5 hours, the solution was cooled on ice. Then, 0.27 ml (3.65 mmols, 1.0 eq.) of  $\beta$ -aminopropionitrile was added to the solution, and the temperature of the solution was then returned to room temperature. After stirring for 3 hours, the solution was then allowed to stand overnight. Next, the solution was concentrated under reduced pressure, and the resulting residue was crystallized from methanol, thereby obtaining 1.08 g (3.19 mmols, 90.4%) of the desired compound in the state of other crystals.

mp: >270°C

NMR (DMSO- $d_6$ )  $\delta$ : 9.04 (s, 1H), 8.90 (m, 1H), 8.64 (d, 1H), 8.37 (d, 1H), 8.25-8.14 (m, 1H), 7.89 (t, 1H), 7.83-7.67 (m, 2H), 3.54 (q, 2H), 2.82 (t, 2H)

Reaction 3

1H-2-(3-nitrophenyl)benzimidazole-5-[N-(2-amidinoethyl)]carboxamide hydrochloride

1.08 g (3.22 mmols) of 1H-2-(3-nitrophenyl)benzimidazole-5-[N-(2-cyanoethyl)]carboxamide was suspended in 40 ml of ethanol, and a hydrochloric acid gas was then blown into the suspension under ice cooling. After the suspension was saturated with a hydrochloric acid gas over 30 minutes, the temperature of the suspension was returned to room temperature, followed by stirring for 3 hours. Next, the suspension was concentrated under reduced pressure. The resulting residue was decanted twice with ether and then suspended in 40 ml of ethanol, and an ammonia gas was blown thereinto under ice cooling. After saturated with the ammonia gas over 50 minutes, the suspension was stirred at room temperature for 3 hours, and then allowed to stand overnight. Next, the suspension was concentrated under reduced pressure, and the resulting residue was then sludged with methanol/acetone. The resulting solid was purified through silica gel column chromatography (ethyl acetate/IPA/water = 5/2/1), and then sludged with methylene chloride and successively IPA to obtain 0.67 g (1.72 mmols, 53.5%) of the desired compound in the state of creamy crystals.

mp: >270°C

NMR (DMSO- $d_6$ )  $\delta$ : 9.10-9.06 (m, 3H), 8.88 (t, 0.5H), 8.79 (t, 0.5H), 8.71 (bs, 3H), 8.35 (d, 1H), 8.31 (s, 0.5H), 8.15 (s, 0.5H), 7.88 (t, 1H), 7.88 (d, 1H), 7.75 (d, 0.5H), 7.63 (d, 1H), 3.65 (q, 2H), 2.73 (t, 2H)

Reaction 4

1H-2-[3-[[4-[4-[N,N-bis(2-chloroethyl)amino]phenyl]butyryl]amino]phenyl]benzimidazole-5-[N-(2-amidinoethyl)]carboxamide hydrochloride

0.33 g (0.83 mmol) of 1H-2-(3-nitrophenyl)benzimidazole-5-[N-(2-amidinoethyl)]carboxamide hydrochloride was suspended in a mixed solvent of DMF and methanol, and catalytic hydrogenation was then carried out in the presence of 10% Pd/C as a catalyst to lead the above-mentioned compound to a corresponding amino compound. This DMF solution was stirred under ice cooling and under a nitrogen gas stream, and a methylene chloride solution of 4-[4-[N,N-bis(2-chloroethyl)amino]phenyl]butyryl chloride [which was prepared by adding 0.55 g (4.6 mmols, 5.0 eq.) of thionyl chloride to 0.28 g (0.92 mmol) of chlorambucil, removing thionyl chloride under reduced pressure after 5 minutes, and then carrying out azeotropic distillation with benzene twice] was added dropwise. The temperature of the suspension was returned to room temperature, followed by stirring for 7 hours. Next, the suspension was concentrated under reduced pressure, and the resulting residue was then purified through silica gel column chromatography (ethyl acetate/IPA/water = 6/2/1), and then solidified with ethanol to obtain 0.23 g (0.36 mmols, 43.4%) of the desired compound in the state of light yellowish white crystals.

mp: A definite melting point was not present.

NMR (DMSO- $d_6$ )  $\delta$ : 10.31 (s, 1H), 9.09 (s, 2H), 8.98 (t, 1H), 8.68 (s, 1H), 8.66 (s, 2H), 8.27 (s, 1H), 7.97 (d, 2H), 7.78 (d, 1H), 7.70 (d, 1H), 7.58 (t, 1H), 7.07 (d, 2H), 6.68 (d, 2H), 3.65 (m, 2H), 2.72 (t, 2H), 2.55 (m, 2H), 2.40 (t, 2H), 1.89 (m, 2H)

IR (KBr)  $\text{cm}^{-1}$ : 3064, 1690, 1519, 1310, 1245, 810, 723

10 Example 2 (Compound 2)

15 1H-2-[4-[[4-[N,N-bis(2-chloroethyl)amino]phenyl]butyryl]amino]phenyl]benzimidazole-5-[N-(2-amidinoethyl)carboxamide hydrochloride

Reaction 1

Methyl 3,4-diaminobenzoate

20 3.0 g of 3,4-diaminobenzoic acid was suspended in methanol, and 1.86 ml of thionyl chloride was then added dropwise. Afterward, thionyl chloride was further added as much as 0.5 ml twice, and the suspension was then heated under reflux for 11 hours. Next, thionyl chloride and methanol were distilled off, and the residue was dissolved in methylene chloride, washed with a 0.5N aqueous sodium hydroxide solution and a saturated sodium chloride solution, and  
25 then dried over sodium sulfate. After the solvent was distilled off, the residue was sludged with n-hexane to obtain 3.04 g (93%) of the desired compound.

NMR (CDCl<sub>3</sub>) δ: 7.47 (dd, 1H), 7.41 (d, 1H), 6.67 (d, 1H), 3.85 (s, 3H)

Reaction 2

30 Methyl 1H-2-(4-nitrophenyl)benzimidazole-5-carboxylate

In 60 ml of nitrobenzene were dissolved 1.0 g (6.0 mmols) of methyl 3,4-diaminobenzoate and 0.91 g (6.0 mmols) of p-nitrobenzaldehyde (slightly undissolved), and the solution was then heated in an oil bath at 150°C for 39 hours.  
35 Next, the solution was cooled with ice water, and the resulting crystals were collected by filtration to obtain 1.54 g (5.2 mmols, 86.5%) of the desired compound in the state of brown crystals.

mp: >280°C

NMR (DMSO-d<sub>6</sub>) δ: 8.44 (d, 2H), 8.31 (d, 2H), 8.16 (s, 1H), 7.9-7.7 (m, 2H), 3.9 (s, 3H)

40 Reaction 3

1H-2-(4-nitrophenyl)benzimidazole-5-carboxylic acid

In 20 ml of methanol was suspended 1.0 g (3.4 mmols) of methyl 1H-2-(4-nitrophenyl)benzimidazole-5-carboxylate, and  
45 20 ml of a 1N aqueous sodium hydroxide solution was then added, followed by heating and stirring at 60°C for 1 hour. Next, an amount corresponding to that of methanol was distilled off under reduced pressure. Water was added to the remaining reaction solution, and the solution was then acidified with 4N hydrochloric acid. Afterward, the resulting crystals were collected by filtration to obtain 0.94 g (3.3 mmols, 97.6%) of the desired compound in the state of yellowish white crystals.

50 mp: >278°C

NMR (DMSO-d<sub>6</sub>) δ: 8.47 (d, 2H), 8.43 (d, 2H), 8.25 (s, 1H), 7.9 (d, 1H), 7.7 (d, 1H)

Reaction 4

55 1H-2-(4-nitrophenyl)benzimidazole-5-[N-(2-cyanoethyl)]carboxamide

In 42 ml of DMF was dissolved 0.48 g (1.69 mmols) of 1H-2-(4-nitrophenyl)benzimidazole-5-carboxylic acid, and 0.33 g (2.04 mmols, 1.2 eq.) of CDI was added, followed by stirring at room temperature under a nitrogen gas stream. After 3 hours, the solution was cooled on ice, and 0.14 ml (1.9 mmols, 1.1 eq.) of β-aminopropionitrile was then added.

Next, the solution was stirred for 3 hours at room temperature and allowed to stand overnight. After concentration under reduced pressure, the resulting residue was sludged with methanol to obtain 0.47 g (1.4 mmols, 82.9%) of the desired compound in the state of yellow crystals.

mp: >270°C

NMR (DMSO- $d_6$ )  $\delta$ : 8.94-8.9 (m, 1H), 8.45 (s, 4H), 8.3 (s, 0.5H), 8.1 (s, 0.5H), 7.85 (d, 0.5H), 7.65 (d, 0.5H), 3.54 (q, 2H), 2.82 (t, 2H)

#### Reaction 5

1H-2-(4-nitrophenyl)benzimidazole-5-[N-(2-amidinoethyl)]carboxamide hydrochloride

In 10 ml of ethanol was suspended 0.47 g (1.4 mmols) of 1H-2-(4-nitrophenyl)benzimidazole-5-[N-(2-cyanoethyl)]carboxamide, and a hydrochloric acid gas was blown into the suspension over 30 minutes under ice cooling to saturate the suspension with the gas. Afterward, the suspension was stirred at room temperature for 2 hours to precipitate a solid after it was once dissolved. After concentration under reduced pressure, the resulting residue was sludged with ether, collected by filtration, and then suspended in 15 ml of ethanol. Next, an ammonia gas was blown into the suspension over 2 hours to saturate it with the gas, whereby a solid was precipitated after it was once dissolved. The reaction system was allowed to stand overnight, as it was. Next, methanol and acetone were added to the reaction solution, and the undissolved precipitate was collected by filtration to obtain 0.42 g (1.1 mmols, 77.9%) of the desired compound in the state of yellow crystals.

mp: >279°C

NMR (DMSO- $d_6$ )  $\delta$ : 9.5 (bs, 3H), 8.83 (m, 1H), 8.5 (d, 2H), 8.43 (s, 1H), 8.24 (s, 1H), 7.83 (d, 1H), 7.7 (d, 1H), 3.65 (m, 2H), 2.72 (t, 2H)

#### Reaction 6

1H-2-[4-[[4-[N,N-bis(2-chloroethyl)amino]phenyl]butyryl]amino]phenyl]benzimidazole-5-[N-(2-amidinoethyl)]carboxamide hydrochloride

0.24 g (3.3 mmols) of thionyl chloride was added to 0.12 g (0.39 mmol) of chlorambucil, and the mixture was then stirred at room temperature for 5 minutes. Next, thionyl chloride was distilled off under reduced pressure and further removed by doing azeotropic distillation with benzene twice, and methylene chloride was then added. This solution was added to a DMF solution containing 0.54 mmol of 1H-2-(4-aminophenyl)benzimidazole-5-[N-(2-amidinoethyl)]carboxamide hydrochloride (which was obtained by subjecting the nitro compound of Reaction 5 to catalytic hydrogenation using 10% Pd/C as a catalyst) under ice cooling, and the solution was stirred at room temperature for 5 hours and then allowed to stand overnight. Next, a formed solid was removed by filtration, and the filtrate was then concentrated under reduced pressure. The resulting residue was purified through silica gel column chromatography (methylene chloride/methanol/acetic acid = 80/20/1), and then crystallized from ether, thereby obtaining 71 mg (0.11 mmols, 20.4%) of the desired compound in the state of light brown crystals.

## Example 3 (Compound 90)

2-[3-(formylamino)phenyl]benzimidazole-5-[N-(2-amidinoethyl)]carboxamide hydrochloride

5 Reaction 1

1H-2-(3-nitrophenyl)benzimidazole-5-[N-(2-amidinoethyl)]carboxamide hydrochloride

10 In 40 ml of ethanol was suspended 1.08 g (3.22 mmols) of 1H-2-(3-nitrophenyl)benzimidazole-5-[N-(2-cyanoethyl)]carboxamide, and a hydrochloric acid gas was blown into the suspension over 30 minutes under ice cooling to saturate the suspension with the gas. Next, the temperature of the suspension was returned to room temperature, and after stirring for 3 hours, the suspension was concentrated under reduced pressure. The resulting residue was decanted twice with ether and then suspended in 40 ml of ethanol, and an ammonia gas was blown thereinto under ice cooling over 50 minutes to saturate the suspension with the ammonia gas. Afterward, the temperature of the suspension was returned to room temperature, and the suspension was stirred for 3 hours and then allowed to stand overnight. Next, the suspension was concentrated under reduced pressure, and the resulting residue was then sludged with methanol/acetone. The resulting solid was purified through silica gel column chromatography (ethyl acetate/IPA/water = 5/2/1), and then sludged with methylene chloride and IPA to obtain 0.67 g (1.72 mmols, 53.5%) of the desired compound in the state of creamy crystals.

Reaction 2

25 1H-2-[3-(formylamino)phenyl]benzimidazole-5-[N-(2-amidinoethyl)]carboxamide hydrochloride

30 In a mixed solvent of 8 ml of DMF and 8 ml of methanol was suspended 0.65 g (1.67 mmols) of 1H-2-(3-nitrophenyl)benzimidazole-5-[N-(2-amidinoethyl)]carboxamide hydrochloride, and catalytic hydrogenation was then carried out by using 0.28 g of 10% Pd/C as a catalyst. Next, the suspension was concentrated under reduced pressure, and to an 1/2 amount (a solution containing about 4 ml of DMF) of the concentrated suspension, a formylimidazole-THF solution [which was prepared by adding 0.16 ml (4.2 mmols) of formic acid to a mixture of 0.67 g (4.1 mmols) of CDI and 12 ml of THF, and then stirring the solution at room temperature in a nitrogen atmosphere for 1 hour] was added dropwise under ice cooling in a nitrogen atmosphere, and the temperature of the suspension was returned to room temperature. Afterward, the suspension was stirred for 5 hours and then allowed to stand overnight. Next, the suspension was concentrated under reduced pressure, and the resulting residue was purified through silica gel column chromatography (ethyl acetate/IPA/H<sub>2</sub>O = 6/2/1) and further purified preparative TLC (ethyl acetate/IPA/H<sub>2</sub>O = 5/2/1) twice, and then solidified with IPA-ether to obtain 17 mg (0.044 mmol, 5.3%) of the desired compound in the state of yellow amorphous powder.

Example 4 (Compound 45)

2-[4-(formylamino)phenyl]benzimidazole-5-[N-(2-amidinoethyl)]carboxamide hydrochloride

Reaction 1

1H-2-(4-aminophenyl)benzimidazole-5-[N-(2-amidinoethyl)]carboxamide hydrochloride

In a mixed solvent of 4 ml of DMF and 4 ml of methanol was dissolved 0.42 g (1.08 mmols) of 1H-2-(4-nitrophenyl)benzimidazole-5-[N-(2-amidinoethyl)]carboxamide hydrochloride, and catalytic hydrogenation was then carried out by using 0.18 g of 10% Pd/C as a catalyst. After the removal of the catalyst, methanol was distilled off, and the half of the solution containing DMF was taken out and used in the next reaction.

Reaction 2

1H-2-[4-(formylamino)phenyl]benzimidazole-5-[N-(2-amidinoethyl)]carboxamide hydrochloride

A solution, which had been prepared by adding 0.10 ml (2.65 mmols) of formic acid to 4 ml of a THF solution containing 0.44g (2.7 mmols) of CDI and then stirring the solution at room temperature for 30 minutes under a nitrogen gas stream, was added dropwise to a DMF solution containing 0.54 mmol of 1H-2-(4-aminophenyl)benzimidazole-5-[N-(2-amidinoethyl)]carboxamide hydrochloride under ice cooling under a nitrogen gas stream with stirring. Afterward, the temperature of the solution was returned to room temperature, followed by stirring for 6.5 hours. Next, the solution was concentrated under reduced pressure, and the resulting residue was purified through reversed phase silica gel column chromatography (ODS, water/methanol = 50%), and then crystallized from ethanol-ether to obtain 36 mg (0.093 mmol, 17.2%) of the desired compound in the state of white crystals.

1H-2-[4-(formylamino)phenyl]benzimidazole-5-[N-[3-(dimethylamino)propyl]]carboxamide

Reaction 1

1H-2-(4-nitrophenyl)benzimidazole-5-[N-[3-(dimethylamino)propyl]]carboxamide

In 50 ml of DMF was dissolved 0.50 g (1.77 mmols) of 1H-2-(4-nitrophenyl)benzimidazole-5-carboxylic acid, and 0.34 g (2.1 mmols, 1.2 eq.) of CDI was added, followed by stirring at room temperature in a nitrogen atmosphere. After 4 hours, the solution was cooled on ice. Then, 0.24 ml (1.9 mmols, 1.1 eq.) of N,N-dimethyl-1,3-propanediamine was added to the solution, and the temperature of the solution was returned to room temperature and the solution was then allowed to stand overnight. After the completion of the reaction had been confirmed, the solution was concentrated under reduced pressure, and the resulting residue was sludged with methanol to obtain 0.52 g (1.42 mmols, 80.2%) of the desired compound in the state of yellowish white crystals.

#### Example 6 (Compound 29)

1H-2-[4-[[4-[N,N-bis(2-chloroethyl)amino]phenyl]butyryl]amino]phenyl]benzimidazole-5-[N-[3-(dimethylamino)propyl]]carboxamide

In a mixed solvent of 6 ml of DMF and 4 ml of methanol was suspended 0.15 g (0.41 mmol) of 1H-2-(4-nitrophenyl)benzimidazole-5-[N-[3-(dimethylamino)propyl]]carboxamide, and catalytic hydrogenation was then carried out by the use of 10% Pd/C as a catalyst to lead it to a corresponding amino compound. Next, this compound was dissolved in 8 ml of DMF, and 0.12 g (0.39 mmol, 0.96 eq.) of chlorambucil and 61 mg (0.45 mmol, 1.1 eq.) of HOBt were then added. Afterward, 96 mg (0.47 mmol, 1.1 eq.) of DCC was further added under ice cooling in a nitrogen atmosphere, and the temperature of the solution was returned to room temperature. Next, the solution was stirred for 7 hours and then allowed to stand overnight. Since the reaction did not complete, a solution prepared by the following procedure was added to the reaction system, followed by stirring for 10 hours. The above-mentioned solution was prepared by reacting 0.12 g (0.39 mmol, 0.95 eq.) of chlorambucil with 0.24 g of thionyl chloride at room temperature for 5 minutes, removing thionyl chloride by azeotropic distillation with benzene, and then dissolving the thionyl chloride-free material in methylene chloride. After the completion of the reaction had been confirmed, the resulting solid was removed by filtration, and the filtrate was then concentrated under reduced pressure. Afterward, the resulting residue was purified through alumina column chromatography (ICN, Almina N, methylene chloride/methanol = 2%), and then crystallized from ether to obtain 0.13 g (0.21 mmol, 51.2%) of the desired compound in the state of white crystals.

Example 7 (Compound 1001)

1H-2-[4-(guanidinoacetyl amino)phenyl]benzimidazole-5-[N-[4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide dihydrochloride

Reaction 1

1H-2-(4-nitrophenyl)benzimidazole-5-[N-[4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide

In 8 ml of DMF were suspended 0.26 g (0.96 mmol) of 1H-2-(4-nitrophenyl)benzimidazole-5-carboxylic acid and 0.27 g (0.95 mmol) of N,N-bis(2-chloroethyl)-1,4-phenylenediamine hydrochloride, and the solution was then stirred under a nitrogen gas stream, while cooled on ice. Next, 0.40 ml (2.87 mmols, 3.0 eq.) of triethylamine and 0.22 ml (1.45 mmols, 1.5 eq.) of DECP were added in this order, and the solution was stirred for 3 hours and then allowed to stand overnight, as it was. After concentration under reduced pressure, the resulting residue was sludged with methanol to obtain 0.33 g (0.66 mmol, 69.7%) of the desired compound in the state of light brown crystals.

mp: >250°C

NMR (DMSO-d<sub>6</sub>) δ: 10.11 (s, 0.5H), 10.05 (s, 0.5H), 8.46 (s, 4H), 8.42 (s, 0.5H), 8.17 (s, 0.5H), 7.95-7.84 (m, 1.5H), 7.68 (d, 0.5H), 6.77 (d, 2H), 6.64 (d, 2H), 3.74 (s, 8H)

Reaction 2

1H-2-[4-(guanidinoacetyl amino)phenyl]benzimidazole-5-[N-[4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide dihydrochloride

0.12 ml of 1N hydrochloric acid was added to a solution composed of a mixed solvent of DMF and methanol and 50 mg (0.10 mmol) of 1H-2-(4-nitrophenyl)benzimidazole-5-[N-[4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide. Then the mixture was subjected to catalytic hydrogenation in the presence of 10% Pd/C as a catalyst to lead it to a corresponding amino compound. Next, the DMF solution of this amino compound was stirred under a nitrogen gas stream while cooled on ice, and 20 µl (0.14 mmol, 1.4 eq.) of triethylamine, 46 mg (0.30 mmol, 3.0 eq.) of guanidineacetic acid hydrochloride and 62 mg (0.30 mmol, 3.0 eq.) of DCC were added in this order. Afterward, the temperature of the solution was returned to room temperature, and the solution was stirred for 2 hours and then allowed to stand overnight. After the removal of a formed solid by filtration, the filtrate was then concentrated under reduced pressure. The resulting residue was subjected to gel filtration (Sephadex LH-20, methanol), and 4N hydrochloric acid and dioxane were added to the eluted fraction. Next, the solution was concentrated and then sludged with methanol to obtain 10 mg (0.016 mmol, 15.6%) of the desired compound in the state of white crystals.

Example 8 (Compound 1010)

1H-2-[4-(guanidinoacetyl amino)phenyl]benzimidazole-5-[N-[3-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide

Reaction 1

m-[N,N-bis(2-hydroxyethyl)amino]nitrobenzene

In 36 ml of 30% acetic acid was dissolved 5.0 g (36.2 mmols) of m-aminonitrobenzene, and 22.9 ml of ethylene oxide was further added under ice cooling, followed by stirring at room temperature overnight. After extraction with ethyl acetate, the ethyl acetate layer was dried over sodium sulfate and concentrated. The resulting residue was sludged with ether to obtain 5.21 g (23.0 mmols, 63.6%) in the state of yellow crystals.

mp: 98.5-100°C

NMR (DMSO-d<sub>6</sub>) δ: 7.51 (d, 1H), 7.51 (s, 1H), 7.32 (t, 1H), 6.99 (d, 1H), 3.89 (t, 4H), 3.73 (bs, 2H), 3.65 (t, 4H)

Reaction 2

## 3-[N,N-bis(2-chloroethyl)amino]nitrobenzene

5 In 25 ml of toluene was suspended 2.5 g (11.0 mmols) of 3-[N,N-bis(2-hydroxyethyl)amino]nitrobenzene, and 10.2 g (85.7 mmols, 7.8 eq.) of thionyl chloride was added under ice cooling. Next, the suspension was heated and stirred for 5 hours in an oil bath at 70°C. After concentration under reduced pressure, the solution was extracted with ethyl acetate after addition of water. After drying over anhydrous sodium sulfate, the extracted layer was concentrated under reduced pressure, and the resulting residue was then sludged with ether to obtain 2.67 g (10.1 mmols, 92.2%) of the

10 desired compound in the state of yellow crystals.  
mp: 112-113°C

NMR (CDCl<sub>3</sub>) δ: 7.61 (d, 1H), 7.50 (t, 1H), 7.39 (t, 1H), 6.98 (d, 1H), 3.83 (t, 4H), 3.68 (t, 4H)

Reaction 3

## N,N-bis(2-chloroethyl)-1,3-phenylenediamine hydrochloride

15 In 35 ml of concentrated hydrochloric acid was dissolved 2.0 g (7.6 mmols) of 3-[N,N-bis(2-chloroethyl)amino]nitrobenzene, and 6.9 g (30.6 mmols, 4.0 eq.) of stannic chloride (II) dihydrate was added, followed by stirring for 1 hour in an oil bath at 100°C. Next, the solution was allowed to stand until its temperature lowered to room temperature, and then diluted with water. The solution was basified with concentrated ammonia water, extracted with ethyl acetate twice, dried over anhydrous sodium sulfate, and then concentrated under reduced pressure. Afterward, 4N hydrochloric acid and dioxane were added to the resulting residue, and after concentration, the residue was crystallized

25 yellow crystals.  
mp: 195-201°C

NMR (DMSO-d<sub>6</sub>) δ: 10.30-9.80 (bs, 3H), 7.27 (t, 1H), 6.76 (d, 1H), 6.73 (s, 1H), 6.63 (d, 1H), 3.74 (s, 8H)

Reaction 4

## 1H-2-(4-nitrophenyl)benzimidazole-5-[N-3-[N,N-bis(2-chloroethyl)amino]phenyl]carboxamide

30 In 10 ml of DMF were dissolved 0.30 g (1.06 mmols) of 1H-2-(4-nitrophenyl)benzimidazole-5-carboxylic acid and 0.29 g (1.08 mmols, 1.0 eq.) of N,N-bis(2-chloroethyl)-1,3-phenylenediamine hydrochloride, and the solution was then stirred under a nitrogen gas stream, while cooled on ice. Next, 0.44 ml (3.15 mmols, 3.0 eq.) of triethylamine and 0.24 ml (1.58 mmols, 1.5 eq.) of DECP were added in this order, and the solution was stirred for 9 hours and then allowed to stand overnight, as it was. After concentration under reduced pressure, the resulting residue was purified through silica gel column chromatography (chloroform/methanol = 2-4%) and then sludged with ethanol to obtain 0.23 g (0.46 mmol, 43.5%) of the desired compound in the state of yellowish white crystals.

40 mp: 213-217°C

NMR (DMSO-d<sub>6</sub>) δ: 10.20 (s, 0.5H), 10.11 (s, 0.5H), 8.47 (s, 4H), 8.43 (s, 1H), 8.16 (s, 0.5H), 7.92 (d, 0.5H), 7.86 (s, 0.5H), 7.71 (d, 0.5H), 7.31-7.15 (m, 3H), 6.51 (d, 1H), 3.80-3.74 (m, 8H)

Reaction 5

## 1H-2-[4-(guanidinoacetyl)amino]phenyl]benzimidazole-5-[N-3-[N,N-bis(2-chloroethyl)amino]phenyl]carboxamide dihydrochloride

45 In DMF-methanol, 50 mg (0.10 mmol) of 1H-2-(4-nitrophenyl)benzimidazole-5-[N-3-[N,N-bis(2-chloroethyl)amino]phenyl]carboxamide was subjected to catalytic hydrogenation using 10% Pd/C as a catalyst to lead it to a corresponding amino compound. Next, the DMF solution of this amino compound was stirred under a nitrogen gas stream while cooled on ice, and 44 mg (0.29 mmol, 2.9 eq.) of guanidineacetic acid hydrochloride and 59 mg (0.29 mmol, 2.9 eq.) of DCC were added in this order. Afterward, the temperature of the solution was returned to room temperature, and the solution was stirred for 5 hours and then allowed to stand overnight. After the removal of a formed

50 solid by filtration, the filtrate was then concentrated under reduced pressure. Next, DMF was added to the residue, and the resulting crystals were removed by filtration. The concentrated residue of the filtrate was subjected to gel filtration (Sephadex LH-20, methanol), and 4N hydrochloric acid and dioxane were added to the eluted fraction, followed by concentration. The concentrated material was crystallized from ether to obtain 31 mg (0.048 mmol, 48.0%) of the desired compound in the state of light yellowish white crystals.

mp: 200-210°C

#### Example 9 (Compound 2001)

1H-2-[3-(guanidinoacetyl amino)phenyl]benzimidazole-5-[N-[4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide dihydrochloride

#### Reaction 1

1H-2-(3-nitrophenyl)benzimidazole-5-[N-[4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide

In 12 ml of DMF were dissolved 0.30 g (1.06 mmols) of 1H-2-(3-nitrophenyl)benzimidazole-5-carboxylic acid and 0.29 g (1.08 mmols, 1.0 eq.) of N,N-bis(2-chloroethyl)-1,4-phenylenediamine hydrochloride, and the solution was then stirred under a nitrogen gas stream while cooled on ice. Next, 0.45 ml (3.23 mmols, 3.0 eq.) of triethylamine and 0.24 ml (1.58 mmols, 1.5 eq.) of DECP were added in this order, and the solution was stirred for 3 hours and then allowed to stand overnight, as it was. After concentration under reduced pressure, methanol was added to the resulting residue, and the solution was then allowed to stand for 3 hours. Next, the resulting solid was collected by filtration to obtain 0.45 g (0.90 mmol, 85.2%) of the desired compound in the state of ochreous powder.

mp: A definite melting point was not present.

NMR (DMSO- $d_6$ )  $\delta$ : 10.06 (bs, 1H), 9.06 (s, 1H), 8.66 (d, 1H), 8.38 (d, 1H), 8.38 (s, 0.5H), 8.16 (s, 0.5H), 7.90 (t, 1H), 7.93-7.70 (m, 2H), 7.63 (d, 2H), 6.77 (d, 2H), 3.74 (s, 8H)

#### Reaction 2

1H-2-[3-(guanidinoacetyl amino)phenyl]benzimidazole-5-[N-[4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide dihydrochloride

In DMF-methanol, 0.15 g (0.30 mmol) of 1H-2-(3-nitrophenyl)benzimidazole-5-[N-[4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide was subjected to catalytic hydrogenation using 10% Pd/C as a catalyst to lead it to a corresponding amino compound. Next, the DMF solution of this amino compound was stirred under a nitrogen gas stream while cooled on ice, and 0.14 g (0.91 mmols, 3.0 eq.) of guanidineacetic acid hydrochloride and 0.19 g (0.92 mmol, 3.0 eq.) of DCC were added in this order. Afterward, the temperature of the solution was returned to room temperature, and the solution was stirred for 9 hours and then allowed to stand overnight. After the removal of a formed solid by filtration, the filtrate was concentrated under reduced pressure. Next, the residue was subjected to gel filtration (Sephadex LH-20, methanol), and 4N hydrochloric acid and dioxane were added to the eluted fraction, followed by concentration. The concentrated solution was crystallized from methanol, thereby obtaining 0.13 g (0.20 mmol, 67.7%) of the desired compound in the state of light yellowish white crystals.

Example 10 (Compound 2004)

1H-2-[3-(guanidinoacetyl amino)phenyl]benzimidazole-5-[N-[3-methyl-4-[N,N-bis(2-chloroethyl)amino]phenyl]] carboxamide dihydrochloride

Reaction 1

1H-2-(3-nitrophenyl)benzimidazole-5-[N-[3-methyl-4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide

In 30 ml of DMF were dissolved 3.1 g (11 mmols) of 1H-2-(3-nitrophenyl)benzimidazole-5-carboxylic acid and 3.1 g (11 mmols, 1.0 eq.) of 3-methyl-4-[N,N-bis(2-chloroethyl)amino]aniline hydrochloride, and the solution was then stirred under a nitrogen gas stream while cooled on ice. Next, 2.5 ml (16 mmols, 1.5 eq.) of DECP and 4.6 ml (33 mmols, 3.0 eq.) of triethylamine were added in this order, and the solution was stirred at 0°C for 30 minutes and at room temperature for 3 hours and then allowed to stand overnight. After the reaction solution was concentrated under reduced pressure, the resulting residue was dissolved in acetone. Next, silica gel was added thereto, and the solution was evaporated to dryness under reduced pressure and then purified through silica gel column chromatography (chloroform/methanol = 8/2). After the solvents were distilled off under reduced pressure, the resulting residue was sludged with chloroform and a small amount of methanol. Next, the resulting powder was collected by filtration and then washed with methanol, thereby obtaining 4.2 g (yield = 75%) of ochreous powder.

mp: A definite melting point was not present.

NMR (DMSO- $d_6$ )  $\delta$ : 10.22 (s, 0.5H), 10.16 (s, 0.5H), 9.06 (s, 1H), 8.66 (d, 1H), 8.42-8.36 (m, 1.5H), 8.17 (s, 0.5H), 7.93-7.62 (m, 5H), 7.24 (d, 1H), 3.57 (t, 4H), 3.39 (t, 4H), 2.31 (s, 3H)

Reaction 2

1H-2-[3-(guanidinoacetyl amino)phenyl]benzimidazole-5-[N-[3-methyl-4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide dihydrochloride

In a mixed solvent of 5 ml of DMF and 5 ml of methanol, 0.40 g (0.78 mmol) of 1H-2-(3-nitrophenyl)benzimidazole-5-[N-[3-methyl-4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide was subjected to catalytic hydrogenation using 10% Pd/C as a catalyst to lead it to a corresponding amino compound. Next, the DMF solution of this amino compound was stirred under a nitrogen gas stream while cooled on ice, and 281 mg (2.3 mmols, 3 eq.) of guanidineacetic acid hydrochloride and 483 mg (2.3 mmols, 3 eq.) of DCC were added in this order. After stirring at 0°C for 30 minutes, the solution was further stirred at room temperature for 6 hours and then allowed to stand overnight. Next, the resulting precipitate was removed by filtration and the solvents were distilled off from the resulting filtrate under reduced pressure. The resulting residue was purified through silica gel column chromatography (chloroform/methanol = 95/5). After the solvents were distilled off under reduced pressure, the resulting residue was dissolved in methanol, and ether was then added to the solution, so that precipitation occurred again, thereby obtaining 155 mg (yield = 34%) of white powder.

NMR (DMSO- $d_6$ )  $\delta$ : 10.83 (s, 1H), 10.44 (s, 1H), 8.68 (s, 1H), 8.37 (s, 1H), 8.09 (d, 2H), 7.89 (d, 1H), 7.82 (d, 1H), 7.73-7.63 (m, 3H), 7.44 (bs, 4H), 7.25 (d, 1H), 4.19 (d, 2H), 3.57 (t, 4H), 3.37 (t, 4H), 2.31 (s, H)

IR (KBr)  $\text{cm}^{-1}$ : 3348, 1665, 1504, 1308, 1263, 884

Example 11 (Compound 2006)

1H-2-[3-(guanidinoacetyl amino)phenyl]benzimidazole-5-[N-[3-chloro-4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide dihydrochloride

Reaction 1

1H-2-(3-nitrophenyl)benzimidazole-5-[N-[3-chloro-4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide

In 7 ml of DMF was dissolved 0.60 g (2.12 mmols) of 1H-2-(3-nitrophenyl)benzimidazole-5-carboxylic acid, and the solution was then stirred under a nitrogen gas stream while cooled on ice. Afterward, 2.45 mmols of 3-chloro-4-[N,N-bis(2-chloroethyl)amino]aniline hydrochloride [which was synthesized from 0.73 g (2.45 mmols) of a corresponding nitro compound by catalytic hydrogenation] and 0.89 ml (6.38 mmols, 3.0 eq.) of triethylamine were added in this order, and 5 ml of DMF was further added. Next, 0.48 ml (3.16 mmols, 1.5 eq.) of DECP was additionally added, the solution was stirred for 6 hours and then allowed to stand overnight, as it was. After concentration under reduced pressure, the resulting residue was purified through silica gel column chromatography (chloroform/methanol = 4%) and then crystallized from ethyl acetate. According to confirmation by NMR, the introduction of triethylamine hydrochloride was observed,

and therefore, together with the resulting filtrate, the crystals were subjected to gel filtration (Sephadex LH-20, methanol). Next, solidification was accomplished with ether, thereby obtaining 0.48 g (0.90 mmol, 42.0%) of the desired compound in the state of ocherous solid.

mp: A definite melting point was not present.

NMR (DMSO- $d_6$ )  $\delta$ : 10.39 (s, 1H), 9.06 (s, 1H), 8.66 (d, 1H), 8.38 (d, 1H), 8.32 (s, 1H), 8.03 (d, 1H), 7.93-7.87 (m, 2H), 7.76 (d, 1H), 7.73 (dd, 1H), 7.37 (d, 1H), 3.64-3.48 (m, 8H)

## Reaction 2

1H-2-[3-(guanidinoacetyl)amino]phenyl]benzimidazole-5-[N-[3-chloro-4-[N,N-bis(2-chloroethyl)amino] phenyl]]carboxamide dihydrochloride

In DMF-methanol, 0.21 g (0.40 mmol) of 1H-2-(3-nitrophenyl)benzimidazole-5-[N-[3-chloro-4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide was subjected to catalytic hydrogenation using 10% Pd/C as a catalyst to lead it to a corresponding amino compound. Next, the DMF solution of this amino compound was stirred under a nitrogen gas stream while cooled on ice, and 0.18 g (1.17 mmols, 3.0 eq.) of guanidineacetic acid hydrochloride and 0.24 g (1.16 mmols, 3.0 eq.) of DCC were added in this order. Afterward, the temperature of the solution was returned to room temperature, and the solution was stirred for 2 hours and then allowed to stand overnight. After the removal of a formed solid by filtration, the filtrate was concentrated under reduced pressure. Next, the residue was subjected to gel filtration (Sephadex LH-20, methanol), and 4N hydrochloric acid and dioxane were added to the eluted fraction, followed by concentration. The concentrated material was solidified with ether, thereby obtaining 0.15 g (0.22 mmol, 55.7%) of the desired compound in the state of light yellowish white power.

mp: A definite melting point was not present.

## Example 12 (Compound 2011)

1H-2-[3-[[4-(guanidino)butyryl]amino]phenyl]benzimidazole-5-[N-[4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide dihydrochloride

In DMF-methanol, 0.20 g (0.40 mmol) of 1H-2-(3-nitrophenyl)benzimidazole-5-[N-[4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide was subjected to catalytic hydrogenation using 10% Pd/C as a catalyst to lead it to a corresponding amino compound. Next, the DMF solution of this amino compound was stirred under a nitrogen gas stream while cooled on ice, and 0.22 g (1.21 mmols, 3.0 eq.) of guanidinobutyric acid hydrochloride and 0.25 g (1.21 mmols, 3.0 eq.) of DCC were added in this order. Afterward, the temperature of the solution was returned to room temperature, and the solution was stirred for 3 hours and then allowed to stand overnight. After the removal of a formed solid by filtration, the filtrate was concentrated under reduced pressure. Next, the residue was purified through silica gel column chromatography (ethyl acetate/IPA/water = 6/2/1) and then subjected to gel filtration (Sephadex LH-20, methanol), and 4N hydrochloric acid and dioxane were added to the eluted fraction, followed by concentration. The concentrated material was solidified with ether, thereby obtaining 0.10 g (0.15 mmol, 37.5%) of the desired compound in the state of yellow power (hygroscopic).

mp: A definite melting point was not present.

NMR (DMSO- $d_6$ )  $\delta$ : 10.59 (s, 1H), 10.32 (s, 1H), 8.69 (s, 1H), 8.36 (s, 1H), 8.10 (d, 1H), 8.05 (d, 1H), 7.95 (t, 1H), 7.87 (d, 1H), 7.79 (d, 1H), 7.65 (m, 3H), 7.50-7.00 (bs, 4H), 6.77 (d, 2H), 3.74 (s, 8H), 3.18 (q, 2H), 1.85 (m, 2H)

### Example 13 (Compound 2014)

1H-2-[3-[[4-(guanidino)butyryl]amino]phenyl]benzimidazole-5-[N-[3-methyl-4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide dihydrochloride

In a mixed solvent of 5 ml of DMF and 5 ml of methanol, 0.40 g (0.78 mmol) of 1H-2-(3-nitrophenyl)benzimidazole-5-[N-[3-methyl-4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide was subjected to catalytic hydrogenation using 10% Pd/C (wet) as a catalyst to lead it to a corresponding amino compound. Next, the DMF solution of this amino compound was stirred under a nitrogen gas stream while cooled on ice, and 426 mg (2.4 mmols, 3 eq.) of 4-guanidinobutyric acid hydrochloride and 450 mg (2.4 mmols, 3 eq.) of EDCI were added in this order. Afterward, the solution was stirred at 0°C for 30 minutes and further at room temperature for 3 hours, and then allowed to stand overnight. The solvents were distilled under reduced pressure, and the resulting residue was then purified through silica gel column chromatography (ethyl acetate/ IPA/water = 5/2/1). After the solvents were distilled off under reduced pressure, the resulting residue was dissolved in methanol and then further subjected to gel filtration column chromatography (Sephadex LH-20, methanol). After the solvents were distilled off under reduced pressure, the resulting residue was then sludged with acetone-IPA, thereby obtaining 113 mg (yield 21%) of the desired compound in the state of light yellow power.

NMR (DMSO-d<sub>6</sub>) δ: 10.58 (s, 1H), 10.44 (s, 1H), 8.69 (s, 1H), 8.36 (s, 1H), 8.11-7.61 (m, 7H), 7.25 (bs, 4H), 7.25 (d, 1H), 4.03 (q, 1H), 3.57 (t, 4H), 3.37 (t, 4H), 3.26 (q, 2H), 2.50 (t, 2H), 2.31 (s, 3H), 1.84 (m, 2H)

### Example 14 (Compound 2016)

1H-2-[3-[[4-(guanidino)butyryl]amino]phenyl]benzimidazole-5-[N-[3-chloro-4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide dihydrochloride

In DMF-methanol, 0.31 g (0.58 mmol) of 1H-2-(3-nitrophenyl)benzimidazole-5-[N-[3-chloro-4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide was subjected to catalytic hydrogenation using 10% Pd/C as a catalyst to lead it to a corresponding amino compound. Next, the DMF solution of this amino compound was stirred under a nitrogen gas stream while cooled on ice, and 0.32 g (1.76 mmols, 3.0 eq.) of guanidinobutyric acid hydrochloride and 0.36 g (1.74 mmols, 3.0 eq.) of DCC were added in this order. Afterward, the temperature of the solution was returned to room temperature, and the solution was stirred for 3 hours and then allowed to stand overnight. Since the material did not disappear the next day, 0.11 g 4-guanidinobutyric acid and 0.12 g of DCC were added, followed by stirring for further 2 hours. After the removal of a formed solid by filtration, the filtrate was concentrated under reduced pressure, and the resulting residue was then purified through silica gel column chromatography (ethyl acetate/ IPA/water = 6/2/1) and then further subjected to gel filtration (Sephadex LH-20, methanol). Next, 4N hydrochloric acid and dioxane were added to the eluted fraction, followed by concentration. The residue was collected by scraping, thereby obtaining 73 mg (0.10 mmol, 17.9%) of the desired compound in the state of a white solid.

mp: A definite melting point was not present.

NMR (DMSO-d<sub>6</sub>) δ: 10.37 (s, 1H), 10.29 (s, 1H), 8.59 (s, 1H), 8.29 (bs, 1H), 8.03 (s, 1H), 7.88-7.72 (m, 6H), 7.51 (t, 1H), 7.36 (d, 1H), 7.40-6.80 (bs, 4H), 3.62 (m, 4H), 3.50 (m, 4H), 3.19 (m, 2H), 2.46 (m, 2H), 1.84 (m, 2H)

Example 18 (Compound 2092)

1H-2-[3-[[3-(methylthio)propionyl]amino]phenyl]benzimidazole-5-[N-[3-methyl-4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide

In a mixed solvent of 5 ml of DMF and 5 ml of methanol, 0.40 g (0.78 mmol) of 1H-2-(3-nitrophenyl)benzimidazole-5-[N-[3-methyl-4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide was subjected to catalytic hydrogenation using 10% Pd/C as a catalyst to lead it to a corresponding amino compound. Next, the DMF solution of this amino compound was stirred under a nitrogen gas stream while cooled on ice, and 281 mg (2.3 mmols, 3 eq.) of 3-(methylthio)propionic acid and 483 mg (2.3 mmols, 3 eq.) of DCC were added in this order. Afterward, the solution was stirred at 0°C for 30 minutes and further at room temperature for 6 hours and then allowed to stand overnight. After the resulting precipitate was removed by filtration, the solvents were distilled off under reduced pressure, and the resulting residue was then purified through silica gel column chromatography (chloroform/methanol = 95/5). After the solvents were distilled off under reduced pressure, the resulting residue was dissolved in methanol, and ether was then added, so that precipitation occurred again, thereby obtaining 155 mg (yield = 34%) of the desired compound in the state of white powder.

NMR (DMSO- $d_6$ )  $\delta$ : 10.21 (s, 1H), 10.16 (s, 1H), 8.57 (s, 1H), 8.24 (bs, 1H), 7.86 (d, 2H), 7.72-7.49 (m, 5H), 7.24 (d, 1H), 3.57 (t, 4H), 3.36 (t, 4H), 2.80 (t, 2H), 2.68 (t, 2H), 2.37 (s, 3H), 2.12 (s, 3H)

Example 19 (Compound 2044)

2-[N-[3-[5-[N-[3-methyl-4-[N,N-bis(2-chloroethyl)amino]phenyl]carbamoyl]-1H-benzimidazole-2-yl]phenyl]carbamoyl-ethyl-dimethylsulfonium iodide

0.10 g (0.17 mmol) of 1H-2-[3-[[3-(methylthio)propionyl]amino]phenyl]benzimidazole-5-[N-[3-methyl-4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide was dissolved in a mixture of 0.6 ml of 80% formic acid, 0.3 ml of acetic acid and 0.5 ml of methyl iodide, and the solution was then stirred at room temperature for 3 hours under shading and then allowed to stand overnight. After concentration under reduced pressure, the resulting residue was purified through gel filtration column chromatography (Sephadex LH-20, methanol, carried out twice). The solvents were distilled off under reduced pressure, and the resulting residue was dissolved in methanol. Afterward, IPA was added to the solution, so that precipitation occurred again, thereby obtaining 58 mg (yield = 47%) of the desired compound in the state of light yellow powder.

NMR (DMSO- $d_6$ )  $\delta$ : 10.56 (s, 1H), 10.20 (s, 1H), 8.59 (s, 1H), 8.27 (s, 1H), 7.91 (d, 2H), 7.78-7.55 (m, 5H), 7.24 (d, 1H), 3.57 (t, 4H), 3.37 (t, 4H), 3.21 (t, 2H), 3.05 (t, 2H), 2.97 (s, 6H), 2.31 (s, 3H)

Example 20 (Compound 2093)

1H-2-[3-[3-(methylthio)propionylamino]phenyl]benzimidazole-5-[N-[3-chloro-4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide

In DMF-methanol, 0.21 g (0.40 mmol) of 1H-2-(3-nitrophenyl)benzimidazole-5-[N-[3-chloro-4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide was subjected to catalytic hydrogenation using 10% Pd/C as a catalyst to lead it to a corresponding amino compound. Next, the DMF solution of this amino compound was stirred under a nitrogen gas stream while cooled on ice, and 0.12 ml (1.16 mmols, 2.9 eq.) of 3-methylthiopropionic acid and 0.24 g (1.16 mmols, 2.9 eq.) of DCC were added in this order. Afterward, the temperature of the solution was returned to room temperature, and the solution was stirred for 2 hours and then allowed to stand overnight. After the removal of a formed solid by filtration, the filtrate was concentrated under reduced pressure, and the resulting residue was subjected to silica gel column chromatography (chloroform/methanol = 4%) and then solidified with ether, thereby obtaining 0.18 g (0.30 mmol, 75.3%) of the desired compound in the state of light yellowish white powder.

mp: A definite melting point was not present.

#### Example 22 (Compound 2051)

1H-2-[3-[(3-morpholinopropionyl)amino]phenyl]benzimidazole-5-[N-[4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxyamide hydrochloride

In DMF-methanol, 0.51 g (1.02 mmols) of 1H-2-(3-nitrophenyl)benzimidazole-5-[N-[4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxyamide was subjected to catalytic hydrogenation using 10% Pd/C as a catalyst to lead it to a corresponding amino compound. Next, the DMF solution of this amino compound was stirred under a nitrogen gas stream while cooled on ice, and 0.21 ml (1.51 mmols, 1.5 eq.) of triethylamine and a chloroform solution containing 1.53 mmols of 3-morpholinopropionyl chloride {which was prepared from 0.30 g (1.53 mmols) of 3-morpholinopropionic acid and 1 ml of thionyl chloride in chloroform} were added in this order. Afterward, the temperature of the solution was returned to room temperature, and the solution was stirred for 3 hours and then allowed to stand overnight. Since the material did not disappear the next day, the chloroform solution containing 1.53 mmols of 3-morpholinopropionyl chloride was further added. After stirring for 9 hours, the solution was concentrated under reduced pressure, and the resulting residue was subjected to silica gel column chromatography (chloroform/methanol = 8-12%). Next, the eluted fraction was concentrated, and methanol was then added. Afterward, the resulting solid was collected by filtration to obtain 0.18 g (0.28 mmol, 27.3%) of the desired compound in the state of light yellowish white powder. Furthermore, the filtrate was subjected to gel filtration (Sephadex LH-20, methanol) and then solidified with ether, thereby obtaining 0.11 g (0.17 mmol, 16.7%) of the desired compound in the state of white powder (total yield = 44.0%).

mp: A definite melting point was not present.

#### Example 23 (Compound 2053)

1H-2-[3-[(3-morpholinopropionyl)amino]phenyl]benzimidazole-5-[N-[4-[N,N-bis(2-chloroethyl)]amino-3-methyl]phenyl]carboxyamide hydrochloride

In a mixed solvent of 10 ml of DMF and 10 ml of methanol was dissolved 0.50 g (1.00 mmol) of 1H-2-(3-nitrophenyl)benzimidazole-5-[N-[4-[N,N-bis(2-chloroethyl)]amino-3-methyl]phenyl]carboxyamide, and catalytic hydrogenation was then carried out under a nitrogen atmosphere in the presence of 10% Pd/C as a catalyst to lead the above-mentioned compound to a corresponding amino compound. Next, the DMF solution of this amino compound was stirred under a nitrogen gas stream while cooled on ice, and 0.59 ml (3.0 mmols) of morpholinoethylcarboxylic acid hydrochloride and 0.62 g (3.00 mmols) of DCC were added in this order. Afterward, the temperature of the solution was returned to room temperature, and the solution was then allowed to stand overnight. After the reaction, the reaction solution was concentrated under reduced pressure, and the resulting brown syrup-like residue was purified through silica gel column chromatography (chloroform/methanol = 20/1-10/1). Next, the resulting fluorescent fraction was taken out, concentrated, and

then sludged with ether/chloroform to obtain 0.25 g (0.38 mmol, 38.0%) of the desired compound in the state of white powder.

mp: A definite melting point was not present.

NMR (DMSO- $d_6$ )  $\delta$ : 10.25 (s, 1H), 10.18 (s, 0.5H), 10.13 (s, 0.5H), 8.55 (d, 1H), 3.34 (s, 0.5H), 8.12 (s, 0.5H), 7.88-7.48 (m, 7H), 7.24 (d, 1H), 3.61-3.50 (m, 8H), 3.64 (t, 4H), 2.67 (t, 2H), 2.54 (t, 2H), 2.43 (bs, 4H), 2.31 (s, 3H)

#### Example 24 (Compound 2054)

1H-2-[3-[(3-morpholinopropionyl)amino]phenyl]benzimidazole-5-[N-[3-chloro-4-[N-bis(2-chloroethyl)amino]phenyl]]carboxamide hydrochloride

In DMF-methanol, 0.30 g (0.56 mmol) of 1H-2-(3-nitrophenyl)benzimidazole-5-[N-[3-chloro-4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide was subjected to catalytic hydrogenation using 10% Pd/C as a catalyst to lead it to a corresponding amino compound. Next, the DMF solution of this amino compound was stirred under a nitrogen gas stream while cooled on ice, and 0.16 ml (1.15 mmols, 2.0 eq.) of triethylamine and a chloroform solution containing 1.13 mmols of 3-morpholinopropionyl chloride [which was prepared from 0.22 g (1.13 mmols) of 3-morpholinopropionic acid and 1 ml of thionyl chloride in chloroform] were added in this order. Afterward, the temperature of the solution was returned to room temperature, followed by stirring. After 3 hours, 0.16 ml (1.15 mmols) of triethylamine and the chloroform solution containing 1.13 mmols of 3-morpholinopropionyl chloride were further added, and the solution was then allowed to stand overnight. After concentration under reduced pressure, the resulting residue was subjected to silica gel column chromatography (chloroform/methanol = 12%). The eluted fraction was further subjected to gel filtration (Sephadex LH-20, methanol), and 4N hydrochloric acid and dioxane were added, followed by concentration. Next, solidification was accomplished with a small amount of ethanoether, thereby obtaining 0.13 g (0.18 mmol, 32.4%) of the desired compound in the state of light yellowish white amorphous powder.

mp: A definite melting point was not present.

NMR (DMSO- $d_6$ )  $\delta$ : 10.80 (s, 1H), 10.61 (s, 1H), 8.62 (s, 1H), 8.37 (s, 1H), 8.04 (m, 3H), 7.87-7.73 (m, 3H), 7.64 (t, 1H), 7.37 (d, 1H), 3.87-3.79 (m, 4H), 3.62 (t, 4H), 3.51 (t, 4H), 3.44 (m, 4H), 3.06 (m, 4H)

#### Example 25 (Compound 2061)

1H-2-[3-(3-pyridylacetyl)amino]phenyl]benzimidazole-5-[N-[4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide

In DMF-methanol, 0.40 g (0.80 mmol) of 1H-2-(3-nitrophenyl)benzimidazole-5-[N-[4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide was subjected to catalytic hydrogenation using 10% Pd/C as a catalyst to lead it to a corresponding amino compound. Next, the DMF solution of this amino compound was stirred under a nitrogen gas stream while cooled on ice, and 0.21 g (1.21 mmols, 1.5 eq.) of 3-pyridylacetic acid hydrochloride and 0.23 g (1.20 mmols, 1.5 eq) of EDCI were added in this order. Afterward, the temperature of the solution was returned to room temperature, followed by stirring for 2.5 hours. After concentration under reduced pressure, the resulting residue was subjected to silica gel column chromatography (chloroform/methanol = 8%), and then solidified with ether. Since some impurities were contained in the powder, a separating operation was carried out by the use of chloroform and dilute ammonia water to precipitate insolubles. Next, the insolubles were collected by filtration to obtain 49 mg (0.083 mmol, 10.4%) of the desired compound in the state of light brown solid. Furthermore, the resulting chloroform layer was concentrated, and then solidified with ether, thereby obtaining 65 mg (0.10 mmol, 12.5%) of the desired hydrochloride in the state of light brown powder.

mp: A definite melting point was not present.

**Example 26** (Compound 2063)

1H-2-[3-(3-pyridylacetyl amino)phenyl]benzimidazole-5-[N-[3-methyl-4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide

In 10 ml of a mixed solvent of DMF:methanol = 1:1, 0.40 g (0.80 mmol) of 1H-2-(3-nitrophenyl)benzimidazole-5-[N-[3-methyl-4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide was subjected to catalytic hydrogenation using 10% Pd/C as a catalyst to lead it to a corresponding amino compound. Next, the DMF solution of this amino compound was stirred under a nitrogen gas stream while cooled on ice, and 0.4 g (2.3 mmols, 3 eq.) of 3-pyridylacetic acid hydrochloride and 0.45 g (2.4 mmols, 3 eq) of EDCI were added in this order, followed by stirring for 30 minutes as it was. After stirred at room temperature for further 3 hours, the solution was allowed to stand overnight. After the solvents were distilled off under reduced pressure, the resulting residue was purified through silica gel column chromatography (chloroform/methanol = 95/5). The solvents were distilled off, and the residue was then dissolved in methanol. Next, isopropyl ether was added, so that precipitation occurred again, to obtain 153 mg (yield = 33%) of white powder.

NMR (DMSO- $d_6$ )  $\delta$ : 10.48 (s, 1H), 10.18 (bs, 0.5H), 10.13 (bs, 0.5H), 8.61-7.36 (m, 13H), 7.23 (d, 1H), 3.77 (s, 2H), 3.59 (t, 4H), 3.36 (t, 4H), 2.31 (s, 3H)

**Example 27** (Compound 2064)

1H-2-[3-(3-pyridylacetyl amino)phenyl]benzimidazole-5-[N-[3-chloro-4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide

In DMF-methanol, 0.40 g (0.75 mmol) of 1H-2-(3-nitrophenyl)benzimidazole-5-[N-[3-chloro-4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxamide was subjected to catalytic hydrogenation using 10% Pd/C as a catalyst to lead it to a corresponding amino compound. Next, the DMF solution of this amino compound was stirred under a nitrogen gas stream while cooled on ice, and 0.21 g (1.21 mmols, 1.6 eq.) of 3-pyridylacetic acid and 0.22 g (1.15 mmols, 1.5 eq) of EDCI were added in this order. Afterward, the temperature of the solution was returned to room temperature, followed by stirring for 3.5 hours. After concentration under reduced pressure, the resulting residue was subjected to a separating operation by the use of chloroform and water to precipitate gel-like insolubles. Next, the resulting aqueous layer was adjusted to a pH of about 11 with an aqueous sodium hydroxide solution and then extracted with chloroform twice. The obtained chloroform layers were joined to each other, dried over anhydrous sodium sulfate, and then concentrated under reduced pressure. Afterward, the residue was solidified with ether, thereby obtaining 96 mg (0.15 mmol, 20.6%) of the desired hydrochloride in the state of light brown powder.

mp: A definite melting point was not present.

NMR (DMSO- $d_6$ )  $\delta$ : 10.47 (s, 1H), 10.37 (s, 0.4H), 10.31 (s, 0.6H), 8.57 (s, 1H), 8.48 (d, 1H), 8.34 (s, 0.6H), 8.11 (s, 0.4H), 8.02 (s, 1H), 7.87-7.61 (m, 7H), 7.52 (t, 1H), 7.40-7.35 (m, 2H), 3.77 (s, 2H), 3.61 (t, 4H), 3.50 (t, 4H)

Example 28 (Compound 2073)

1H-2-[3-(4-pyridylacetyl amino)phenyl]benzimidazole-5-[N-[3-methyl-4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxyamide

In 10 ml of a mixed solvent of DMF:methanol = 1:1, 0.40 g (0.80 mmol) of 1H-2-(3-nitrophenyl)benzimidazole-5-[N-[3-methyl-4-[N,N-bis(2-chloroethyl)amino]phenyl]]carboxyamide was subjected to catalytic hydrogenation using 10% Pd/C as a catalyst to lead it to a corresponding amino compound. Next, the DMF solution of this amino compound was stirred under a nitrogen gas stream while cooled on ice, and 0.4 g (2.3 mmols, 3 eq.) of 4-pyridylacetic acid hydrochloride and 0.45 g (2.4 mmols, 3 eq) of EDCI were added in this order, followed by stirring for 30 minutes as it was. After stirred at room temperature for additional 6 hours, the solution was allowed to stand overnight. After the solvents were distilled off under reduced pressure, the resulting residue was purified through silica gel column chromatography (chloroform/methanol = 6/1). The solvents were distilled off, and the residue was further purified through silica gel column chromatography (chloroform/methanol = 8/1). The solvents were distilled off, and the residue was then dissolved in methanol. Next, isopropyl ether was added, so that precipitation occurred again, to obtain 50 mg (yield = 11%) of light yellow powder.

NMR (DMSO-d<sub>6</sub>)  $\delta$ : 10.51 (s, 1H), 10.18 (bs, 0.5H), 10.13 (bs, 0.5H), 8.61 (s, 1H), 8.55 (d, 2H), 8.33 (s, 0.5H), 8.11 (s, 0.5H), 7.89-7.49 (m, 7H), 7.39 (d, 2H), 7.23 (d, 1H), 3.77 (s, 2H), 3.57 (t, 4H), 3.36 (t, 4H), 2.31 (s, 3H)

IR (KBr) cm<sup>-1</sup>: 3422, 1647, 1508, 1318, 1239, 829

Formulation Example 1

Compound No. 2053 as an active ingredient	30 g
Lactose	68 g
Crystalline cellulose	20 g
Magnesium stearate	2 g

The components described above are mixed in the above composition and the resulting mixture was formulated into core tablets by a tableting machine. Each of the core tablets weighed 120 mg containing 30 mg of Compound No. 2053 and had a diameter of 7 mm.

Talc was then sprinkled on each core tablet and the surface having talc was then coated with varnish to form an undercoat. Additional varnish coating was repeated so as to obtain tablets suitable for the internal uses. Color coating was further conducted. After drying, the tablets having the color coats were waxed and polished into tablets of uniform gloss.

Formulation Example 2

As an active ingredient, 1 g of Compound No. 2053 was weighed and dissolved in 1,000 ml of sterilized propylene glycol. The resting solution was poured and enclosed in ampoules so as to obtain injections in ampoules, each of which contained 5 ml of the solution.

Test Example 1

Investigation was made on the linkage of each compound to DNA. The test was carried out by comparing a T<sub>m</sub> value in the case that the compound was added to the DNA solution with a T<sub>m</sub> value in the case that no compound was added thereto.

That is to say, poly d(A-T)-d(A-T) was used as the DNA. This DNA was dissolved in a buffer solution and the compound was further added thereto, and the T<sub>m</sub> value was then measured. On the other hand, the T<sub>m</sub> of the DNA alone was measured, and a difference ( $\Delta$ T<sub>m</sub>) was then calculated. For the measurement, a U-3200 model spectrophotometer made by Hitachi, Ltd. was used, and for the control of temperature, SPR-10 model made by Hitachi, Ltd. was used.

The  $\Delta$ T<sub>m</sub> of Compound 2001 was obtained, and it was 14°C.

Test Example 2

The anticancer activity of each compound will be described. Table 2 shows the anti-tumor activity of the typical compounds. This test was carried out by measuring an in vitro inhibitory activity on tumor cell growth. That is to say, the B16 melanoma cells of a mouse were planted on a culture plate having 96 cells, and a compound was then added after one day and the cells were cultured at 37°C for 3 days in 5% CO<sub>2</sub>. Next, a compound concentration (IC<sub>50</sub>) necessary to accomplish a 50% growth inhibitory effect was determined in accordance with a procedure described in Cancer. Res., Vol. 48, p. 589-601 (1988). The unit of the drug concentration was µg/ml. The result of distamycin is also simultaneously shown as a comparative example.

Table 2

Anti-tumor activity	
Compound No.	IC <sub>50</sub> (µg/ml)
2	0.58
29	3.05
47	0.38
1001	0.36
1010	3.19
2001	0.82
2004	0.53
2006	0.65
2011	0.97
2014	1.18
2016	2.08
2031	1.56
2041	0.37
2044	0.72
2046	0.39
2051	0.49
2053	0.33
2054	0.41
2063	3.48
2073	1.19
Distamycin	36

Test Example 3

A cell floating solution having  $1 \times 10^7$  mouse colon cancer cells of Colon 26 per ml of HBSS (Hanks' Balanced Salt Solution) was prepared. Next, 0.1 ml of this cell floating solution was implanted in the side abdomen hypodermis of a female CDF1 mouse (0 day). On the day after the tumor implantation (1st day), the weight of the mouse was measured, and a solution of a compound (a 5% glucose solution containing 5% Tween 80) was administered into the tail vein of the mouse. On the 15th day, the tumor was extracted, and its weight was then measured.

An average tumor weight ratio of each experimental sample was calculated as a T/C value on the assumption that the average tumor weight ratio of a control to which any compound was not administered was 100%.

Table 3 shows the results of the test. The T/C values correspond to compound numbers, respectively, and each value in the parentheses represents the concentration of the drug at the time when its T/C value was obtained.

Table 3

Compound No.	T/C (%)	Dose (mg/kg)
2001	13	30
2006	21	10
Adriamycin	29	20

## Claims

1. A compound represented by the following formula (1) or its pharmacologically acceptable salt:

wherein each of m and n is independently an integer of from 0 to 5; each of  $R_1$  and  $R_2$  is independently a hydrogen atom, a halogen atom, an alkylthio group having 1 to 8 carbon atoms, an amino group which may be substituted, an ammonium group which may be substituted, a sulfonium group which may be substituted, a phenyl group which may be substituted, a hetero-five-membered ring group which may be substituted, a hetero-six-membered ring group which may be substituted, an amidino group, a guanidino group, an amino acid residue or a group represented by the formula (2)

wherein  $R_3$  is a direct bond or an oxygen atom (when  $R_3$  is an oxygen atom, m or n of  $(CH_2)_m$  or  $(CH_2)_n$  to which  $R_3$  bonds is not 0);  $R_4$  is a hydrogen atom, an alkyl group having 1 to 8 carbon atoms, an alkoxy group having 1 to 8 carbon atoms, a halogen atom, a trifluoromethyl group, a cyano group, an amidino group, a carboxyl group or  $-\text{COR}_7$  wherein  $R_7$  is an alkylamino group having 1 to 8 carbon atoms which may be substituted by a substituted amino group, an amino group which may be substituted by a phenyl group which may be substituted, or a benzylamino group which may be substituted;  $R_5$  is a hydrogen atom, an alkyl group having 1 to 8 carbon atoms, an alkoxy group having 1 to 8 carbon atoms or a halogen atom;  $R_6$  is a  $-(CH_2)_pN(R_8)_2$  or  $-(CH_2)_pNR_8R_9$  wherein p is an integer of from 0 to 5;  $R_8$  is  $-\text{CH}_2\text{CH}_2\text{W}$  wherein W is a halogen atom, a hydroxyl group, a mesyloxy group or a tosyloxy group or  $-\text{OCOR}_7$  wherein  $R_7$  is as defined above;  $R_9$  is an alkyl group having 1 to 5 carbon atoms or a mesyl group;

the phenyl group having a  $R_1(CH_2)_mCONH$  group in formula (1) can be substituted by the  $R_1(CH_2)_mCONH$  group at any position of the phenyl group.

2. The compound or its pharmacologically acceptable salt according to claim 1 wherein  $R_1$  and/or  $R_2$  is an alkylthio group having 1 to 4 carbon atoms.

3. The compound or its pharmacologically acceptable salt according to claim 1 wherein the phenyl group having a  $R_1(CH_2)_mCONH$  group in formula (1) is substituted by the  $R_1(CH_2)_mCONH$  group at the 3- or 4-position of the phenyl group.
- 5 4. The compound or its pharmacologically acceptable salt according to Claim 1 or 3 wherein  $R_1$  is a halogen atom or a group represented by formula (2).
- 5 5. The compound or its pharmacologically acceptable salt according to any one of Claims 1, 3 or 4 wherein  $R_2$  is a halogen atom or a group represented by formula (2).
- 10 6. The compound or its pharmacologically acceptable salt according to Claim 4 wherein  $R_2$  is an amino group which may be substituted, a guanidino group or an amidino group.
- 15 7. The compound or its pharmacologically acceptable salt according to Claim 5 wherein  $R_1$  is an amino group which may be substituted, a guanidino group or an amidino group.
8. A pharmaceutical composition comprising as an active ingredient, a compound or its pharmacologically acceptable salt described in any one of Claims 1 to 7.
- 20 9. A pharmaceutical composition according to claim 8 which is an anticancer composition.
10. A pharmaceutical composition according to claim 8 which is an antimicrobial composition.
11. A pharmaceutical composition according to claim 8 which is an antiviral composition.
- 25 12. Use of a compound or its pharmacologically acceptable salt described in any one of Claims 1 to 7 for the preparation of an anticancer agent, an antimicrobial agent or an antiviral agent.
